TSUBAKI
ENGINEERING CLASS CHAIN

ENGINEERING CLASS DRIVE CHAIN

Keep Your Operation Moving with Tsubaki Chain

Tsubaki Drive Chains are designed to exceed the listed ultimate strength ratings. These ratings are very significant. Chains with greater ultimate strength have higher actual yield and greater fatigue strength. With Tsubaki chains, you get extra reserve strength to withstand high shock loads.

Precision Manufacturing Means Greater Fatigue Strength

Tsubaki Engineering Class Drive Chains are built to withstand the most rugged conditions. We use the latest manufacturing and heat-treating techniques to manufacture every component. Each component is carefully machined to close tolerances to ensure precise pitch control for smooth sprocket/chain interaction. That means longer service life for chain and sprockets.

Add the Power of Alloy

When parts require extra hardness, we use alloy steel to make the components. This provides more uniform core strength, which is particularly important for heavy duty applications. Every Tsubaki Drive Chain with an ultimate strength rating higher than 112,000 pounds is made entirely of alloy steel. All Tsubaki Drive Chains are furnished with alloy steel pins.

Reduce Maintenance Costs and Downtime

Tsubaki Drive Chains stand up to the toughest environments for hour after hour of uninterrupted service.

- Optimum strength
- Fatigue resistant
- Pre-tested
- Alloy steel parts
- Press fit construction
- Accurate pitch control

Your equipment is on the line. Count on Tsubaki Chain.

Drive Chain

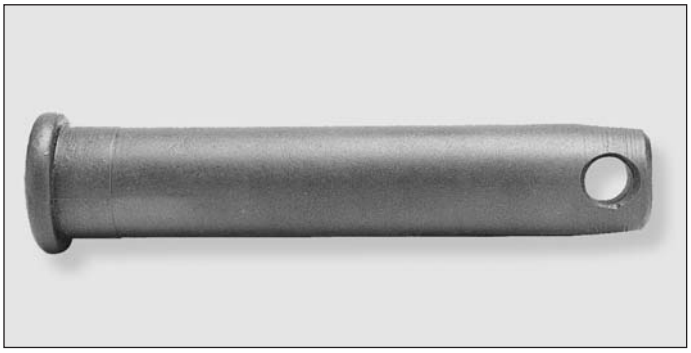
Quality Components

High-Strength Sidebars

Sidebars for Tsubaki Drive Chains with an ultimate strength rating higher than 112,000 pounds are manufactured from alloy steel and are through-hardened. This adds strength and extends the service life of the chain. In addition, our advanced manufacturing techniques ensure accurate hole size and precise pitch control, distributing the load equally and providing smooth sprocket interaction.

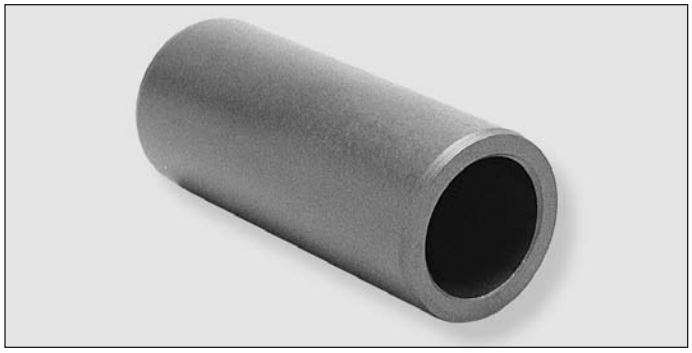
Alloy Steel Induction Hardened Pins

All Drive Chain pins are made from alloy steel and are through-hardened for toughness and strength. In addition, chains designed for heavy duty power shovel applications have ground bearing surfaces and full round induction hardening. This provides the best combination of high yield strength and superior wear resistance.



Precision Machined Bushings

Bushings for Drive Chain are precision machined to provide smooth bearing surfaces—that means less resistance on-line. They are through-hardened or case hardened to meet your application. The result is smooth riding bushings that last.



Shock-Resistant Rollers

Our rollers are made from a high quality material for use when critical tolerances and superior finish are required. Then they are through-hardened to withstand high shock loads. For chains with high ultimate strength ratings, rollers are typically made from alloy steel.

[1]Style: O= offset sidebar; S= straight sidebar

[2]Pin style: K = Full round; A = Double flat.

[3]Material: HC = High carbon; CHT = Carbon heat-treated; AHT = Alloy heat-treated; AHTIH = Alloy heat-treated and induction hardened; CCH = Carbon case hardened; ACH = Alloy case hardened.

To locate compatible sprockets for your chain, refer to the Product Cross-Reference at the back of this section.

Note: Dimensions are subject to change. Contact Tsubaki Technical Support to obtain certified prints for design and construction.

Drive Chain Selection Guidelines

SELECTION GUIDELINES

There are two methods to determine the right drive chain for your application: Standard and Working Load. To determine the suggested chain, follow Steps 1-10 of the Standard Selection Procedure on pages C-6 through C-8. An example procedure is shown on page C-16. Each selection procedure is intended to be used for Engineering Class Drive Chain (ASME/ANSI Standard B29.10).

STANDARD SELECTION PROCEDURE

Step 1: Determine Class of Driven Load
From the Application Classifications Table 1 determine the class of the driven load: uniform load, moderate shock, heavy shock.

Table 1 — Application Classifications

Application	Load Class[1]
Agitators	
Pure Liquids	U
Liquids and Solids	M
Liquids – Variable Density	M
Blowers	
Centrifugal	U
Lobe	M
Vane	U
Brewing and Distilling	
Bottling Machinery	U
Brew Kettles – Cont. Duty	U
Cookers – Cont. Duty	U
Mash Tubs – Cont. Duty	U

Drive Chain Selection Guidelines

Required Information for Drive Selection

- Type of input horsepower (electric motor, internal combustion engine, etc.).
- Type of equipment to be driven.
- Horsepower to be transmitted.
- Full load speed of the fastest running shaft (RPM).
- Desired speed of the slow speed shaft (RPM).
  Note: If speeds are variable, determine maximum and minimum speed and HP to be transmitted at each speed.
- Diameters of the driving and driven shafts.
- Center to center distance of shafts.
  Note: If this dimension is adjustable, determine amount of adjustment.
- Position of drive and space limitations, if any.
- Proposed method of lubrication.
- Conditions of drive. Drives with more than two sprockets, idlers, or unusual conditions such as severely abrasive or corrosive atmosphere, extremely high or low temperatures, severely fluctuating loads, frequent stops and starts, etc., require special consideration. It is advisable to Contact Tsubaki Technical Support for selections of this nature.

[1]U = Uniform load; M = Moderate shock; H = Heavy shock.

Drive Chain Selection Guidelines

Step 2: Select Service Factor
From the Service Factors Table 2 below, select the number under the type of input power and opposite the class of driven load that most closely relates to the application.

Table 2 — Service Factors

Type of Driven Load	Type of Input Power		
	Internal Combustion Engine with Hydraulic Drive	Electric Motor or Turbine	Internal Combustion Engine with Mechanical Drive
Uniform	1.0	1.0	1.2
Moderate Shock	1.2	1.3	1.4
Heavy Shock	1.4	1.5	1.7

Step 3: Calculate Design Horsepower
Design Horsepower = HP x Service Factor.

The Design Horsepower equals the Horsepower to be transmitted multiplied by the Service Factor selected in Step 2.

Step 4: Select Chain Pitch
Use the Quick Selection Chart (page C-11), to find chain pitch, as follows:

- Locate the design horsepower from Step 4 on the vertical axis.
- Locate the RPM of the small sprocket on the horizontal axis.
- The intersection of the two lines (design horsepower and RPM) will be in an area designated with the suggested chain pitch. If the intersection is near the borderline of the pitch area, the pitches on both sides of the line should be evaluated to obtain the most suitable selection.
- If the chain is not listed in the Quick Selection Chart, go to the Working Load Selection Guidelines.

Step 5: Select Number of Teeth in Small Sprocket
Horsepower Table Ratings for single strand chains are given on pages C-12 - C-15 for each chain pitch. Turn to the page giving the chain pitch obtained in Step 4 and select the number of teeth in the small sprocket:

- Read down the column in the Horsepower Ratings Table under the RPM of the small sprocket until the requested HP Table Rating is located. Read across the table to the first column (Number of Teeth Small Sprocket). This is the smallest number of teeth to specify for this application.
- Note the lubrication type specification in the table for this chain. This type of lubrication must be used to obtain reasonable service life.

Step 6: Determine Number of Teeth in Large Sprocket

$$N = \frac{rn}{R}$$

The number of teeth in the large sprocket equals the RPM of the small sprocket times the number of teeth in the small sprocket divided by the RPM of the large sprocket. Note: Hardened teeth are suggested for sprockets with less than 15 teeth, speeds greater than 600 RPM, ratios over 4:1, or in heavy loading or abrasive environments.

Step 7: Determine Suggested Minimum Center Distance; C = Chain Pitches

$$C = \frac{2N + n}{6}$$

This formula is to be used as a guide to MINIMUM center distances only. The final selection may vary slightly to suit clearance dimensions.

Step 8: Check Final Drive Design
Be sure that the sprockets and chain will fit into the available space.

Step 9: Specify Sprockets
Specify the sprockets selected. See Sprocket section in this catalog.

Step 10: Calculate Chain Length

To order the proper length of chain, use the following calculation:

$$\text{Chain Length in Pitches} = \frac{S}{2} + 2C + \frac{K}{C}$$

- Add number of teeth in small sprocket and number of teeth in large sprocket to obtain S.
- Subtract number of teeth in small sprocket from number of teeth in large sprocket to obtain value D. Find D in Table 3, and note corresponding value K.
- Divide center distance in inches by pitch of chain, obtaining C.
- Using these values, solve the formula above.

$$\text{Chain Length in Feet} = \frac{\text{Length in Pitches x Pitch in Inches}}{12}$$

A chain cannot contain a fractional part of a pitch. If the chain length obtained contains a fractional part of a pitch, use the next higher whole number.

Glossary

N = Number of teeth in large sprocket

n = Number of teeth in small sprocket

R = RPM large sprocket

r = RPM small sprocket

C = Shaft center distance in pitches

S = N + n

D = N - n

Drive Chain Selection Guidelines

[1]Used to calculate chain length. See Step 10 on page C-8.

Alternate Working Load Selection Guidelines

Selection of drive chains not listed in the Quick Selection Chart by the Working Load method:

To use a chain that is not listed in the Quick Selection Chart ,
the proper chain can be selected from the working load values given in the chain listings. The working load required can be determined from the following:

Working Load

$$\frac{(HP) \times (396{,}000) \times (E) \times (V)}{(CP) \times (T) \times (RPM)}$$

Where:

HP = Actual horsepower required. (Use motor HP if actual is not known.)

CP = Chain pitch (inches)

T = Number of teeth in smaller sprocket. (12T are suggested.)

RPM = Speed of smaller sprocket.

E = Speed factor (from Speed Correction Factors Table 11 on page C-51. A 12T sprocket is suggested.)

V = Service factor (obtain from Service Factors Table 10 on page C-51.)

This Working Load formula is not to be compared with the selection tables since the tables involve other considerations in addition to working load. **This formula is intended only to supplement the selection tables for those cases where a chain other than the ones listed in the selection procedure is required.**

When the Working Load has been determined, select a chain which has a rated working load equal to or greater than the working load value.

Calculation of Shaft Centers

Use the following formula to determine the approximate centers in pitches for chain lengths in pitches already determined. Contact Tsubaki Technical Support for fixed center drives.

$$C = \frac{L - \frac{N+n}{2} + \sqrt{\left(L - \frac{N+n}{2}\right)^2 - 8\,\frac{(N-n)^2}{4\pi^2}}}{4}$$

Where:

C = Shaft center distance in pitches.

L = Length of chain in pitches.

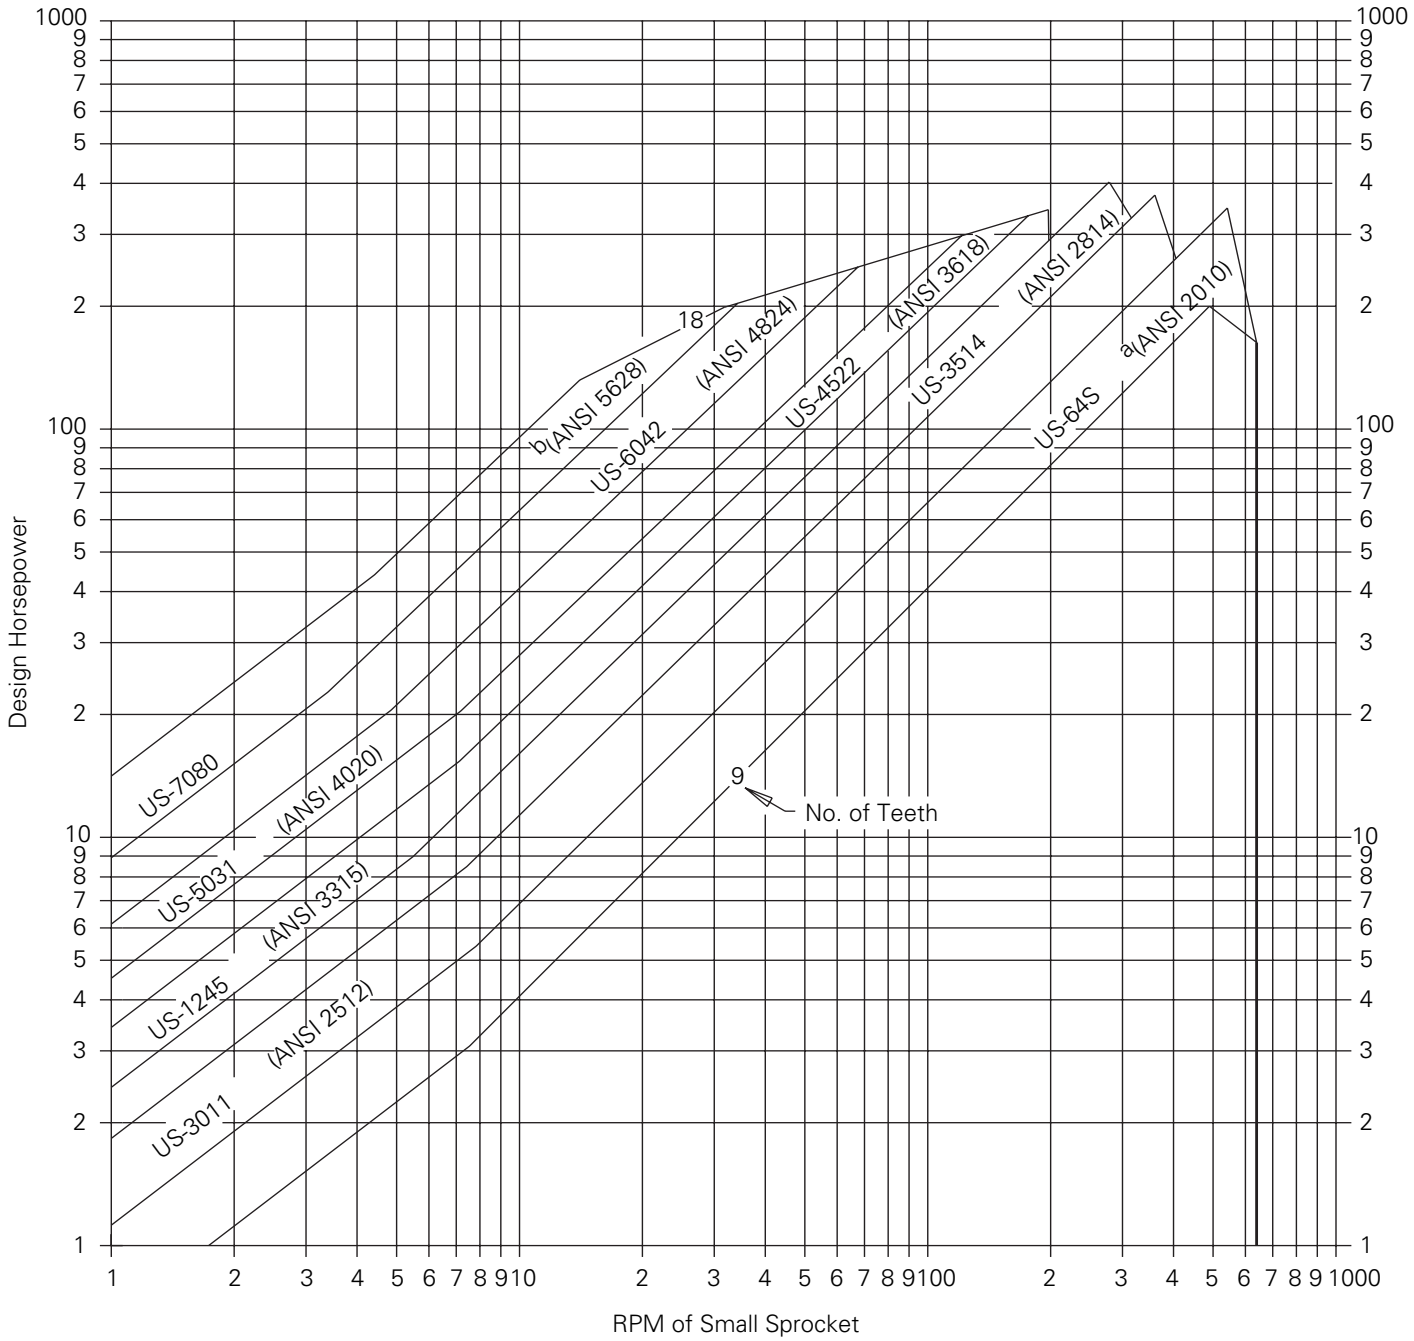
N = Number of teeth in larger sprocket.

n = Number of teeth in smaller sprocket.

π = 3.1416.

Drive Chain Selection Guidelines

Quick Selection Chart



a.This chain has straight sidebars. No. 2010 ANSI standard chain has been assigned. (US-64S does not run on 2010 (US-2570) sprockets.)

b.This chain has straight sidebars. No. 5628 ANSI standard chain has been assigned. (US-7080 does not run on 5628 (US-7060) sprockets.)

Lower line is for 9 tooth US-64S. Top line is for 18 tooth US-7080. Intermediate lines are approximate mid-points for sprocket tooth range shown in HP charts, pages C-12 - C-15. Where the horsepower-RPM intersection lands near a line, both chains on each side should be checked on the charts.

The horsepower ratings in the following pages apply to lubricated single strand Engineering Drive Chains operating on cut tooth sprockets.

For continuous operation, some galling of the live bearing surfaces of the chain joints may be expected even though lubrication is as suggested.

The ratings shown on these charts are based on chain which operates over machine cut tooth sprockets.

Drive Chain Selection Guidelines

Standard Selection Procedure Example

Engineering Class Drive Chain From Reducer to Apron Feeder Head Shaft

Select the proper Engineering Drive Chain to transmit power from a reducer to an apron feeder head shaft. The input power will be a 25 HP electric motor. The reducer output RPM will be 15 RPM and the head shaft RPM will be 5 RPM. Reducer shaft is 2 15/16" diameter. Head shaft is 3 15/16" diameter. The shaft centers should be minimum suggested.

Step 1: Determine Class of Driven Load

From Table 1 (Application Classifications), the load class for an apron feeder is M, representing moderate shock. (See Feeders, Apron.)

Step 2: Select Service Factor

From Table 2 (Service Factors), for electric motor and moderate shock is 1.3.

Step 3: Calculate Design Horsepower

Design horsepower equals the horsepower transmitted x service factor of 25 x 1.3 = 32.5.

Step 4: Select Chain Pitch

- From the Engineering Drive Chain Quick Selection Chart locate the vertical axis 32.5 design horsepower.
- Locate on the horizontal axis 15 RPM of the small sprocket.
- The intersection of the 32.5 design horsepower and 15 RPM of the small sprocket lines intersect in the area designating 4.5" pitch US-4522 Engineering Drive Chain as the appropriate selection.

Step 5: Select Number of Teeth in Small Sprocket

Interpolating the US-4522 rating table for 15 RPM, a 12-tooth sprocket will transmit 32.6 HP. **Hardened teeth suggested.** Required lubrication is Type I, manual.

Step 6: Determine Number of Teeth in Large Sprocket

$$\text{Number of teeth in large sprocket} = \frac{15 \times 12}{5} = 36$$

Step 7: Determine Suggested Minimum Center Distance

Approximate minimum center distance =

$$\frac{2\,(36) + 12}{6} = \frac{84}{6} = 14 \text{ Pitches}$$

Step 8: Check Final Drive Design

Check the final drive design.

Step 9: Specify Sprockets

12-Tooth Sprocket for US-4522 Chain. Hardened Steel, Type C Hub, 2 15/16" Diameter Bore, 3/4" x 3/8" KW, and 5/8" SS.

36 Tooth Sprocket for US-4522 Chain. Steel Type C Hub, 3 15/16" Diameter Bore, 1" x 1/2" KW, and 5/8" SS.

Step 10: Calculate Chain Length

$$\text{Chain length} = \frac{S}{2} + 2C + \frac{K}{C}$$

$$= \frac{36 + 12}{2} + 2\,(14) + \frac{14.6}{14}$$

$$= 24 + 28 + 1 = 53 \text{ Pitches}$$

Where:

$S = N + n$

C = Shaft center distance in pitches

K = Constant from Table 3, (page C-9)

Roller Conveyor Chain

Reliable Performance for Your Operation

Protect your in-plant processes with high-quality Roller Conveyor Chain. Tsubaki is an expert in the manufacture of specialized conveyors and chain for all major industries.

Performance Is Built In

Tsubaki Roller Conveyor Chain is backed by innovative engineering. Every step in the process is designed to deliver long-lasting Conveyor Chain for your application. You get better performance and longer service life from Tsubaki.

High-Quality Materials

The steels used to make Tsubaki Roller Conveyor Chain are selected for optimum wear and performance. They are manufactured to fine grain practice to ensure greater strength and toughness. We use premium grades of carbon steels on heat-treated and non-heat-treated chains. That means high strength for long-term, reliable performance at your operation.

Precision Manufacturing

Tsubaki uses sophisticated tooling to maximize precision. Our modern press tools pierce and then broach the holes in the sidebars to provide the best bearing area between the pin and sidebar. This careful attention to detail means longer wear life and greater fatigue strength.

Exacting Assembly

Extreme force is required to set the round parts in sidebars to produce a high interference fit. Tsubaki has developed special, high-speed equipment to ensure accurate assembly.

Stock Chain Items

Tsubaki conducted a survey of the marketplace and identified the most commonly used chains. We stock a large inventory of these chains—the largest in the industry. That means you get the chain you need faster than ever before.

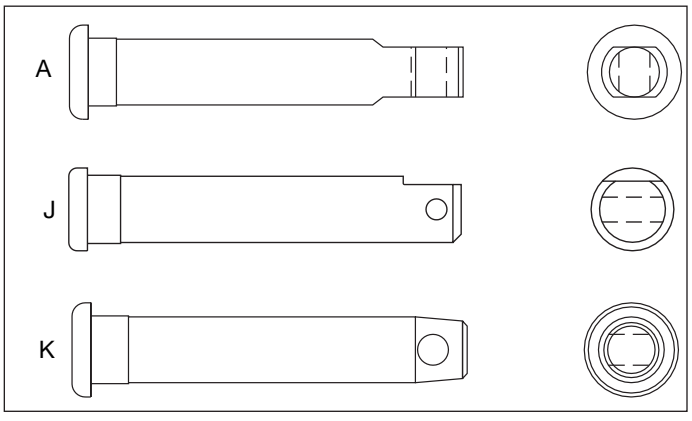
Roller Conveyor Components

Strong, Long-Lasting Pins

Pins for Tsubaki Conveyor Chains are produced from carbon or alloy steel to stand up to the most rugged conditions. Each is produced with the utmost care to ensure proper fit in the sidebars and a smooth bearing surface. Pins are available in through-hardened, case-hardened, and induction-hardened steel to extend the service life even more.

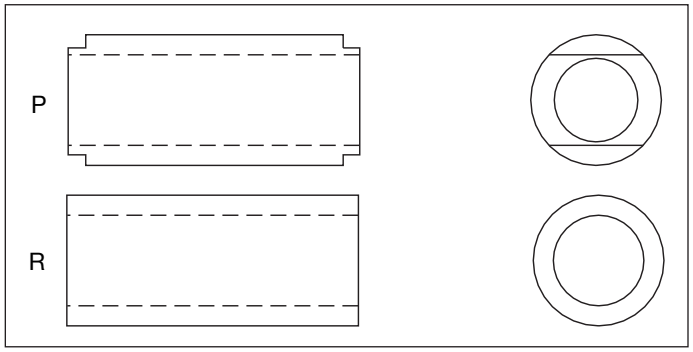
Pin Styles



Smooth Bushings

Bushings are usually produced from carbon or alloy steels, then carburized and case hardened. This heat-treatment, using computer-controlled furnaces, produces high surface hardness for excellent wear with a tough core. Dimensions are carefully controlled to provide a uniform bearing surface and precise fit into the sidebars. Stainless steel bushings are available.

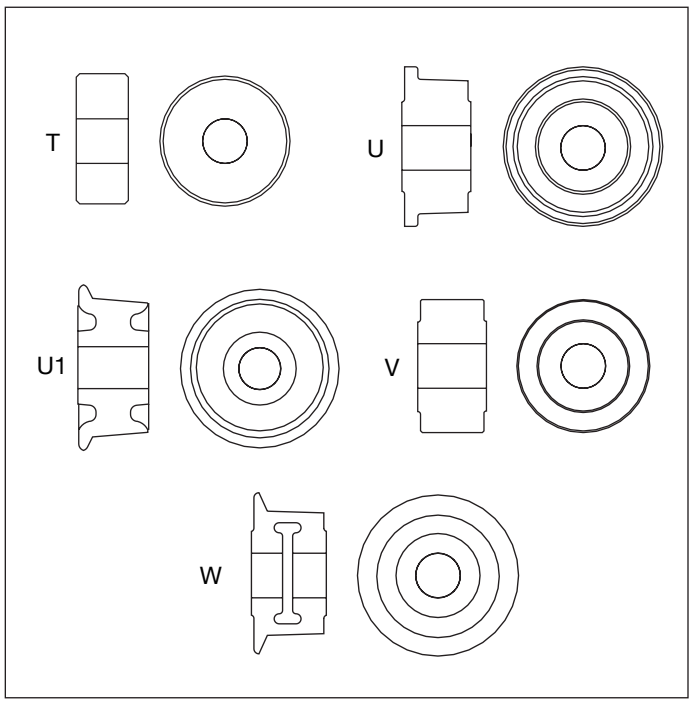
Bushing Styles



Reliable Rollers

Tsubaki offers a variety of steel grades and heat treatments for rollers. Our standard rollers are fabricated using carbon and alloy steels that are carburized and case hardened. They are heat-treated in computer-controlled furnaces to produce a hard bearing surface with a ductile core. Rollers are also available in stainless steels, various plastics, including Delrin and UHMW, and with plastic inserted sleeves on the rollers.

Roller Styles



Precision Manufactured Sidebars

Standard sidebars are made from special grades of carbon or alloy steels to provide tough, long-lasting performance. Stainless steel sidebars are also available for corrosive and high-temperature environments. Pitch and hole size is care-fully controlled to enable the chain to fit precisely with sprockets. This provides proper articulation, extending the life of the chain and the sprockets. Look for the “RX” suffix, which indicates heat-treated sidebars. That means even greater strength and toughness. Also, a wide variety of attachments are available.

Dimensions shown are nominal. Obtain certified prints for design and construction.

[1]Styles for rollers, pins, sidebars, and bushings are shown on pages C-17 - C-18.

[2]Material: CHT = Carbon heat-treated; CCH = Carbon case hardened; AHT = Alloy heat-treated; CRS = Cold rolled steel; AIHT = Alloy iron heat-treated; ACH = Alloy case hardened; HC = High carbon; PMHT = Powdered metal heat-treated.

[3]Offset sidebar.

[4]CC5 is only provided in high sidebar design.

To locate compatible sprockets for your chain, refer to the Product Cross-Reference at the back of this section.

Note: Dimensions are subject to change. Contact Tsubaki Technical Support to obtain certified prints for design and construction.

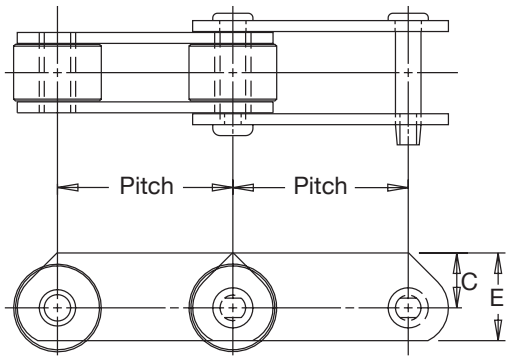
	614R	6.000	2.00	3.00	14.7

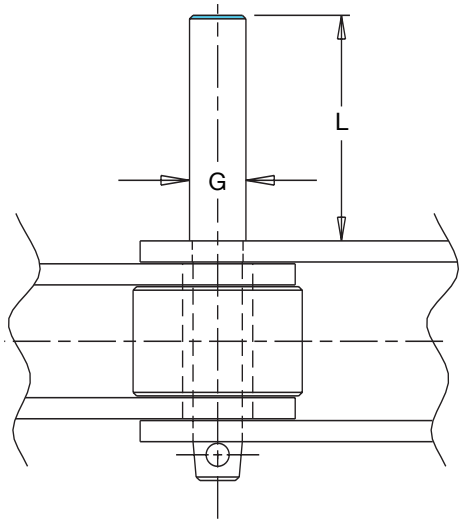


D-1 and D-5

D-1, D-5 Attachments

All dimensions are in inches unless otherwise indicated.

Chain Number	Diameter G	L	Approx. Weight (lbs./ft.)
53R	.75	2.00	4.9
94R	.75	2.00	4.8
US-196R	.75	3.00	5.8



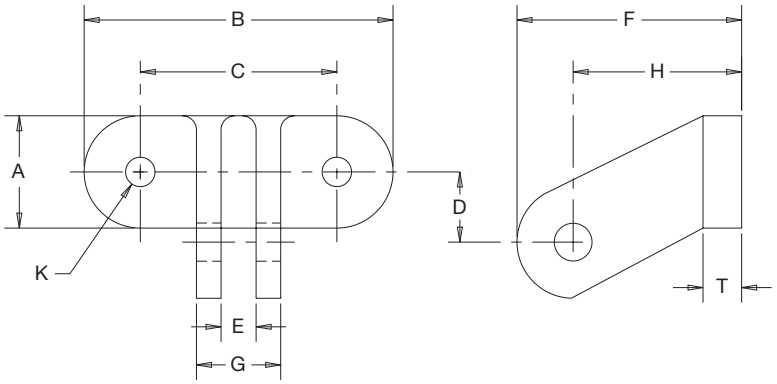
Extended pin attachments of any length can be furnished on all chains listed provided "G" dimension is the same as or exceeds the chain pin diameter.

To locate compatible sprockets for your chain, refer to the Product Cross-Reference at the back of this section.

Note: Dimensions are subject to change. Contact Tsubaki Technical Support to obtain certified prints for design and construction.

Roller Conveyor Chain Attachments

Style C Attachment

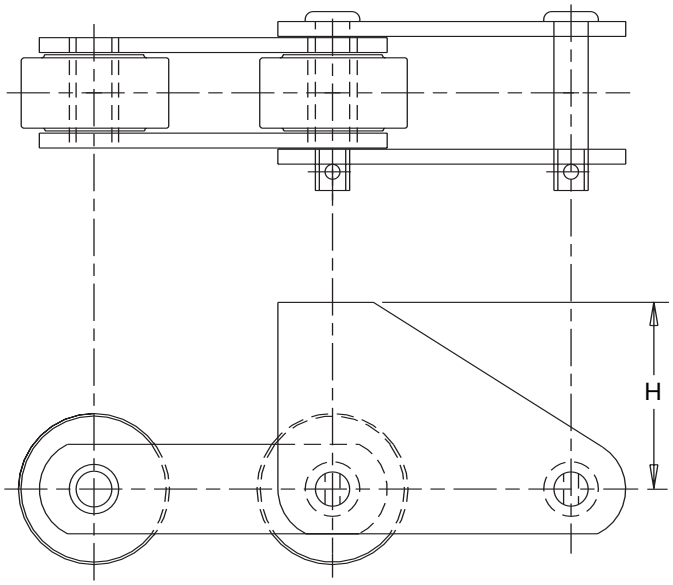


Hinged Bucket and Scraper Flight Wing Attachment Specifications

All dimensions are in inches unless otherwise indicated.

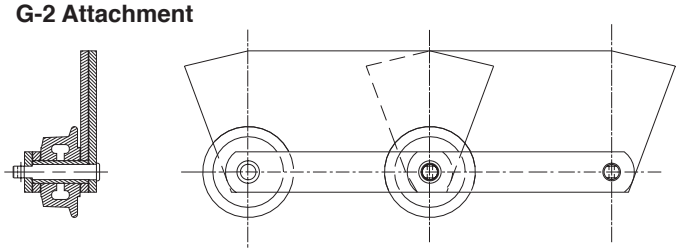
Bucket Wing Style	Attach. No.									Bolt Dia.	Rivet Dia.		Approx. Weight (lbs./ft.)
		A	B	C	D	E	F	G	H	K	L	T	
Style C	2C 15C	2.00 1.75	5.13 3.50	3.50 2.50	1.00 .81	.63 .44	4.00 1.81	1.50 1.00	3.08 1.13	.50 .31	.63 .38	.69 .28	2.8 .7

L-2 and S-1 Attachments



Attachments L-2 and S-1 can be furnished with any chain to suit special requirements provided height of dimension “H” does not exceed five inches from center line of chain.

G-2 Attachment



Attachment G-2 is simply an extra height chain sidebar with attachment angle usually used as pan ends on style B and D apron conveyors as shown on page C-40. It can be furnished with any chain in any reasonable height to suit requirements. The attachment is designated by G-2 followed by a hyphen and number giving overall height in inches. For example, G-2-5 is a sidebar with overall height of 5". G-2-6 1/2 is a sidebar with overall height of 6 1/2".

To locate compatible sprockets for your chain, refer to the Product Cross-Reference at the back of this section.

Note: Dimensions are subject to change. Contact Tsubaki Technical Support to obtain certified prints for design and construction.

APRON CONVEYORS

Move loose bulk materials like coal, lime, sand, stone, and sugar cane along horizontal or inclined conveyors. Apron Conveyors are especially useful as feeders to elevating systems, for picking tables and loading booms, and for long horizontal or inclined conveyors.

Create Custom Solutions

Tsubaki engineers will help you create a complete apron conveyor system for your application, including the right attachments, rollers, and lubrication packages to meet your specific requirements.

Apron Conveyors from Tsubaki

- Wide selection and styles.
- Customized for your application.
- Reliable, hassle-free operation.
- Cost-efficient value for your investment.

Choosing Metal Thickness

Experience is usually the best guideline for specifying the metal thickness for pans and aprons. Make sure you consider the following points.

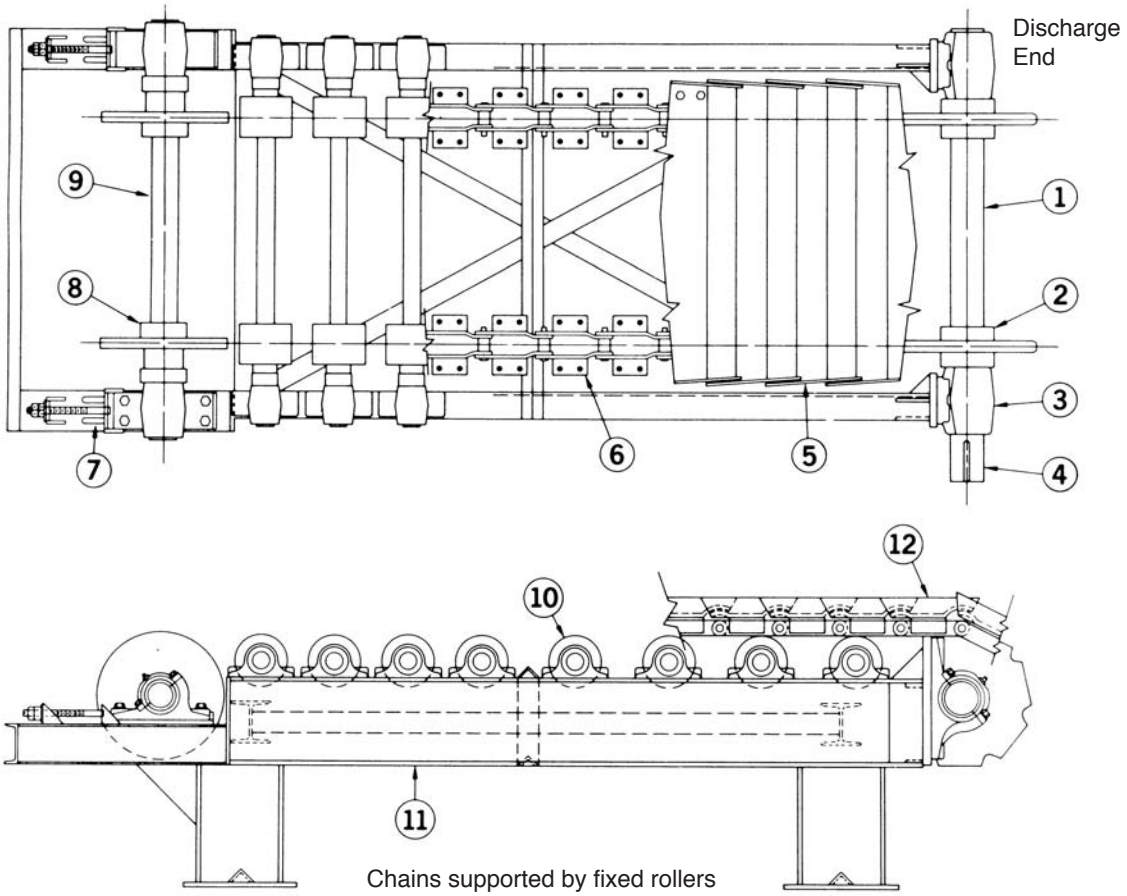
1. Number of chain strands to be used.
2. Required service life.
3. Manufacturing restrictions.
4. Weight of each apron support. Deflection must be limited to prevent binding between overlapping pans.
5. Corrosive and abrasive properties of conveyed materials.
   1. Head shaft — Discharge end.
   2. Head shaft sprockets — Keyed to shaft.

Applications Chart

Pan/Apron Suggested Thickness (inches)	Service Conditions	Material Handled
3/8	Heavy	Highly abrasive, corrosive or large impact loads
1/4 - 5/16	Medium	Moderately corrosive, abrasive or impact loads
3/16	Light	Mildly abrasive, corrosive or impact loads

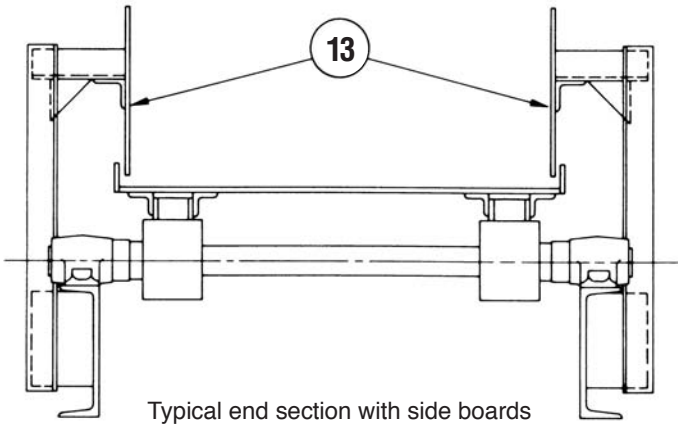
Apron Conveyor Chain

Typical Arrangement—Apron Conveyors



Chains supported by fixed rollers

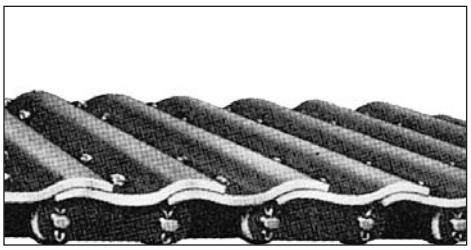
3. Pillow blocks.
4. Drive end — Chain drive.
5. Apron assembly — Bolted to chain attachments.
6. Conveyor chain — Offset sidebar or straight sidebar (two or three strands normally used).
7. Take up — Normally located on tail shaft end.
8. Tail shaft sprockets — Only one keyed to shaft (other sprockets locked in place with collars).
9. Tail shaft.
10. Intermediate rollers — Supports chain sections when conveyor is heavily loaded.
11. Conveyor structure.
12. Pan ends — Welded to aprons.
13. Stationary sideboards — Offer additional capacity.

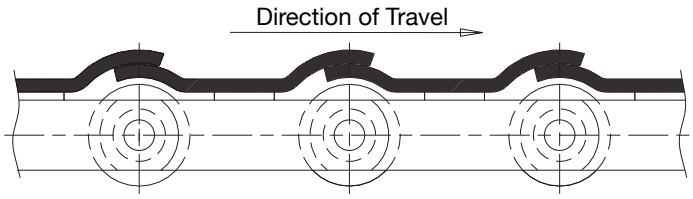


Typical end section with side boards

Apron Conveyor Chain

Style A



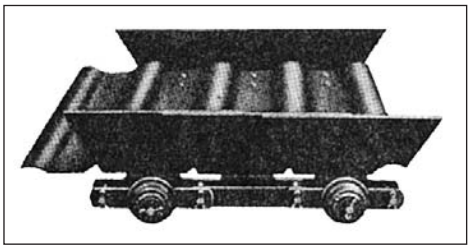


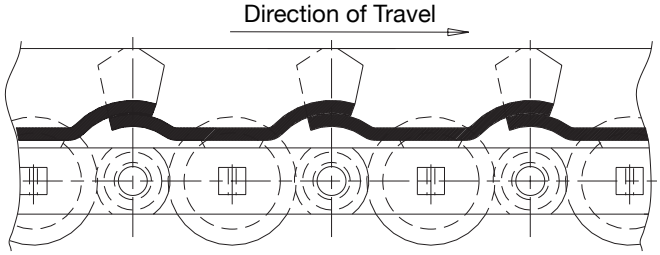
Uses
- Adaptable for any pitch conveyor.
- Most widely used style for horizontal or incline applications up to 35 degrees.

Advantages
- More leakproof than other styles of apron conveyor.
- With K attachments, the load is distributed evenly on both chains.
- Pan ends, when needed, fasten directly to apron and not to chain.

Attachments
- A attachments (one side of chain only) for long center distances.
- K attachments (both sides of chain) for short center distances.

Style A — Outboard Roller Support (OBR)



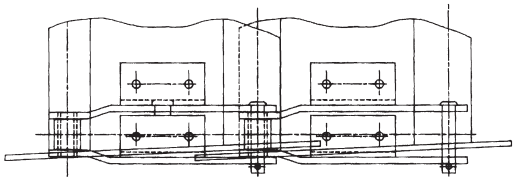


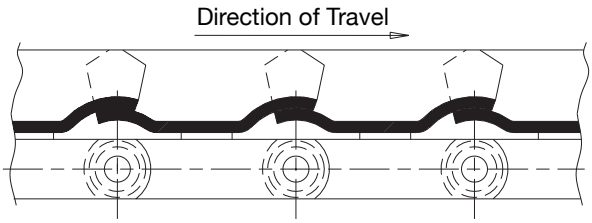
Uses
- Handles fine abrasive materials on incline applications up to 35 degrees.
- Longer pitch conveyors with two strands of chain mounted below and close to the ends of the pans.

Advantages
- Close-fitting members hold leakage to a minimum, protecting the conveyor and avoiding damage when handling abrasives.
- Reduced maintenance costs because outboard rollers may be removed for inspection or renewal without dismantling chains or pans.
- Conveyed load is carried on outboard rollers.
- Head shaft terminal load is carried on chain rollers.

Attachments
- A-2, E-2, M-1 attachments are commonly used.

Style A — Fixed Roller Support





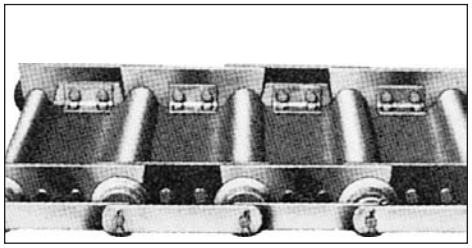
Uses
- Handles heavy conveyed materials.
- Withstands high-impact loads.

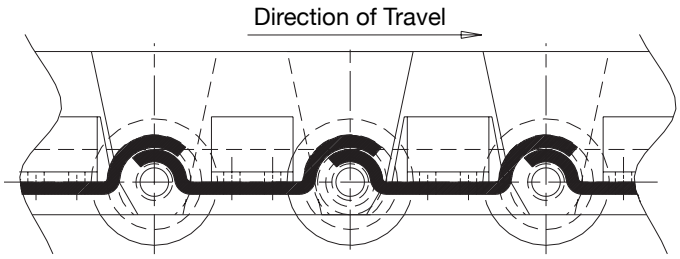
Advantages
- Chain is supported under sidebars by fixed frame rolls that transfer load instead of chain joint rollers.
- The close-fitting members keep leakage to a minimum, protecting your equipment from abrasives.

Attachments
- K attachments usually improve load distribution.
- K-1, K-2, A-1, A-2, E-2 attachments are commonly used.

Apron Conveyor Chain

Style B





Uses

- Suitable for heaviest duty conditions; generally used in longer pitch conveyors.
- Adaptable to various service and operational conditions for horizontal or incline applications as much as 35 degrees.

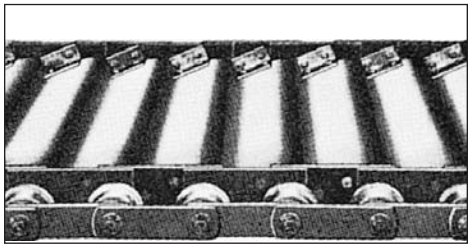
Advantages

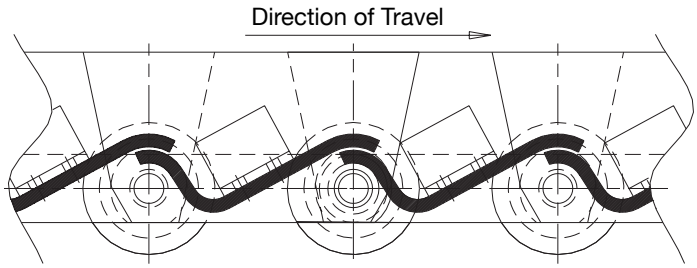
- Deep beads form a rigid pan for heavy loads on wide conveyors.
- Chain rollers permit return strand to roll on a track.
- Through-rods and load deflection rail supports may be used to prevent excessive chain loading under heavy impact conditions.

Attachments

- G-2 attachments (high sidebars with angles) contain material, add strength, and function as moving pan ends.

Style D





Uses

- Positive discharge aprons.
- Adaptable to various service and operating conditions for horizontal or incline applications as much as 35 degrees.

Advantages

- Higher angle of discharge reduces height of fall when unloading, reducing lump breakage.
- Angular mounting of apron on chain helps resist rollback motion of material on inclined conveyors.

Attachments

- G-2 attachments (high sidebars with angles) contain material, add strength, and function as moving pan ends.

[1]All widths and weights are based on 18" apron pan widths. For weight est. refer to "Approximate Weight (lbs.)" column for your specific conveyor width.

[2]Indicates working load for two strands of chain.

[3]Indicates without through-rods. Refer to page C-43 for rod weights.

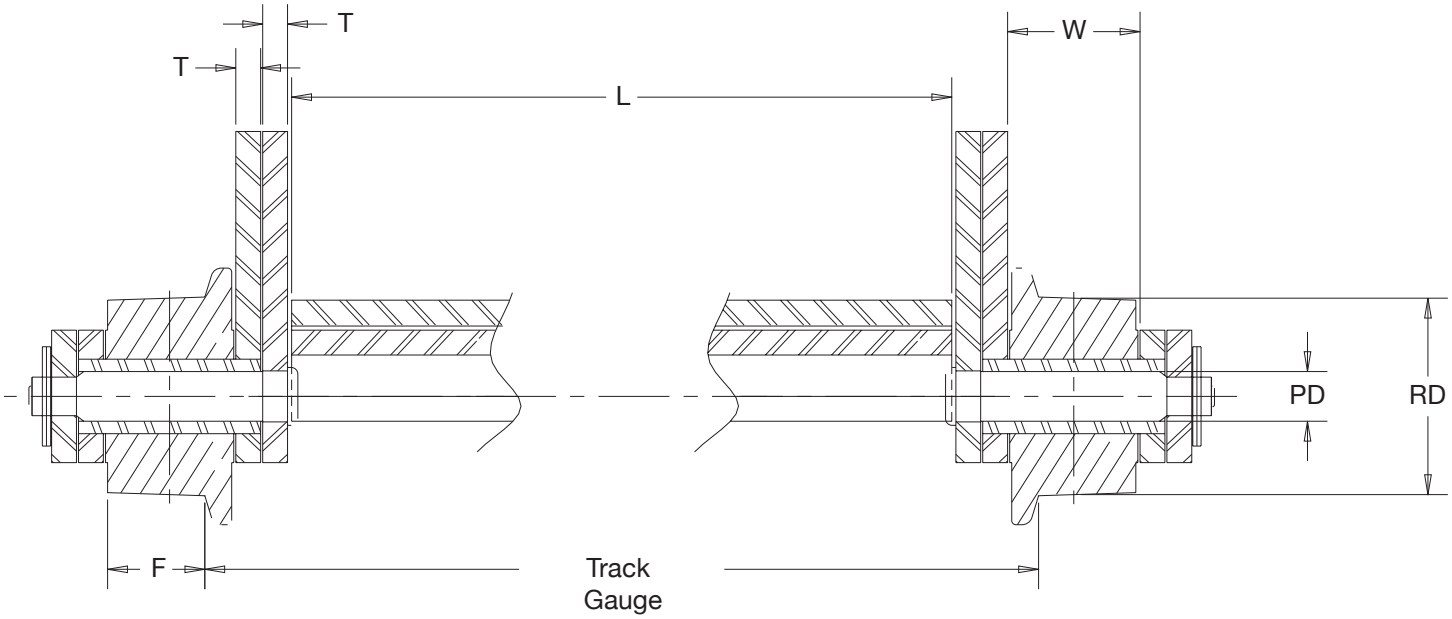
[4]OBR style can be furnished stub shaft every pitch or every 2nd pitch depending on load criteria. All weights shown above are for OBR every pitch. Consult with Tsubaki engineers for selection assistance.

To locate compatible sprockets for your chain, refer to the Product Cross-Reference at the back of this section.

Note: Dimensions are subject to change. Contact Tsubaki Technical Support to obtain certified prints for design and construction.

Apron Conveyor Chain

Apron Conveyor Dimensions



Apron Conveyor Dimensions for Chain with Single Flange Rollers Styles B & D Conveyors

Center to Center of chain = L + 4T + W + 3/16"
Track Gauge = L + 4T + 2k + 1/2"
Center to Center of sprocket = L + 4T + 2k + F + 1/4"
Overall Width = L + 8T + 2W + 2c + 1/4"

Where:

L = Length of apron

T = Thickness of sidebars (chain dimension)

W = Inside width (chain dimension)

F = Width or face of roller tread

k = Constant for diameter of roller

c = Constant for diameter of pin

Values of F and k

Roller Diam. RD	F	k
2.50	.88	.31
3.00	1.09	.41
3.00	1.25	.31
3.50	1.25	.56
4.00	1.25	.59
4.00	1.50	.59
5.00	1.75	.66
5.00	1.75[1]	.72
6.00	1.88	.69
6.00	1.88[1]	.81

[1]Indicates heavier wheel of same width of roller tread.

Values of c

1.50	9.0	12.0	15.0	18.0	21.0	24.0	27.0	30.0

Note: Through-rods are made from high carbon steel. The portions of the ends that act as chain pins are heat-treated for wear resistance.

Roller Conveyor Chain Selection Guidelines

SELECTION GUIDELINES

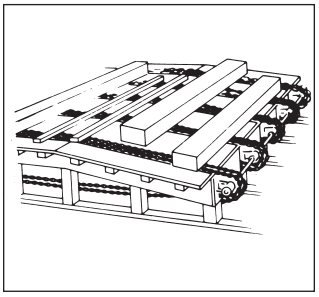
A wide variety of chains are available for the purpose of material handling, conveying, and elevating. An accurate assessment of the basic conditions in which the chain will function is essential for optimum performance. In general, the basic steps of conveyor chain selection are as follows:

- Select a conveyor type appropriate for the material being handled.
- Choose the chain type best suited for the conveyor style selected and the material being handled.
- Select the specific chain size necessary to successfully handle the loading conditions of the conveyor, attachment spacing, space limitations, and other service conditions that are encountered.

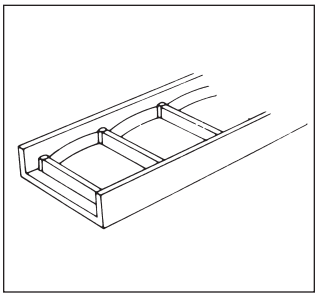
Tsubaki Conveying and Elevating Chains are built to withstand challenging operating conditions including shock loadings and exposure to environments conducive to abrasive wear and/or corrosion. In some more severe applications, special materials or heat treatments are required for successful performance. If you have any questions, contact Tsubaki Technical Support engineering for assistance in making the best choice for your conveying application.

Conveyor Types

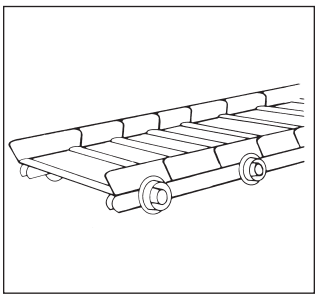
There are, in general, nine types of chain conveyors. The material being handled and the service environment typically determine which type is chosen.



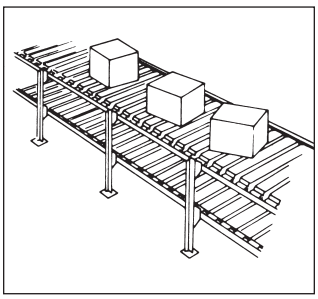
Plain Chain
The chain runs in tracks and the load is carried directly on the chain.



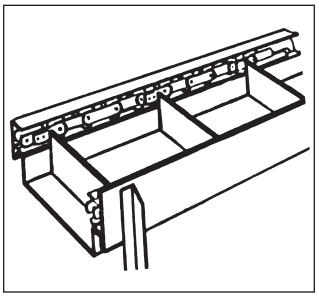
Drag Conveyors
One or more endless strands with or without integral flights moves material in a trough or pan.



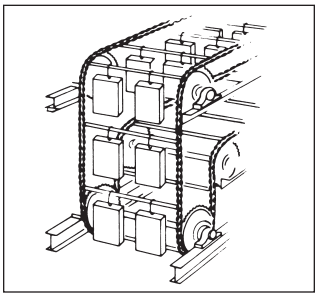
Apron Conveyors
Die formed steel plates or pans mounted on two or more strands of chain. They are good for impact, abrasion and high temperature applications.



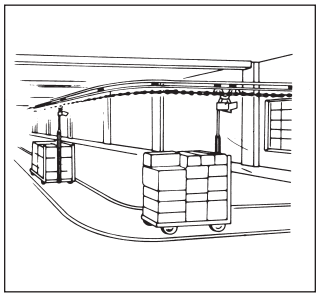
Slat Conveyors
Two or more strands of chain with slats attached at intervals. This is used primarily for unit handling.



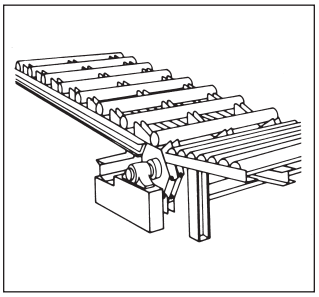
Scraper Flight
One or two endless chains with flights attached to push material in a trough.



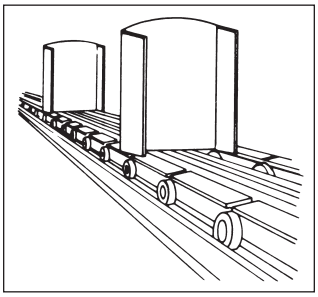
Cross Bar
Two strands of chain connected by cross-bars, which can be arranged in paths from inclined to serpentine.



Trolley and Tow
An endless strand of chain is suspended from an overhead track with carrying attachments at intervals. Tow conveyors have pickups to engage truck masts.



Pusher Chain
One or more strands of endless chain are utilized with attachments to push the load. Load slides or rolls on rails. The chain does not carry the load.



Carrier Chain
Attachments are connected to part of the chain and form a carrying surface for an individual part on a continuous surface.

Roller Conveyor Chain Selection Guidelines

Material Classifications

- Bulk materials (example: limestone)
- Unit materials (example: TV sets)

Table 1 — Typical Material Classifications of Conveyor Types

Conveyor Type	Bulk[1]	Unit[2]
Plain Chain		X
Drag Conveyors	X	
Apron Conveyors	X	
Slat Conveyors		X
Scraper Flight	X	
Cross Bar		X
Trolley and Tow		X
Pusher Chain		X
Carrier Chain		X

[1]Bulk material capacities are typically given as tons per hour (TPH).

[2]Unit material capacities are typically given as pieces (or units) per hour (pcs./hr.)

General Conveyor Chain Types

- Roller Conveyor Chains
- Steel Bushed Rollerless
- Welded Steel Mill Chain
- Welded Steel Drag Chain
- Cast Combination Chain
- Drop Forged Rivetless Chain
- Bar/Pin Chain

Table 2 — Typical Chain Types for Conveyor Service

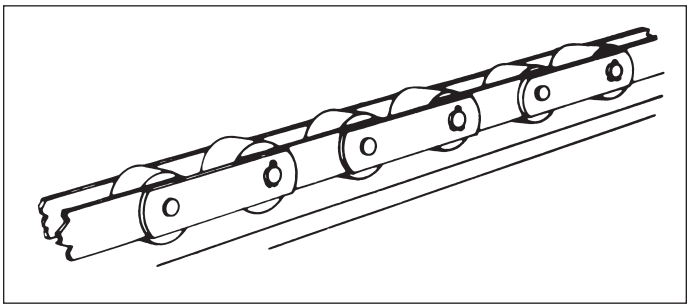
Conveyor Types	Conveyor Chain Types						
	Roller Conveyor	Steel Bushed	Welded Steel	Welded Drag	Cast Combination	Drop Forged	Bar/Pin
Plain Chain	X	X	X	X	X		X
Drag Conveyors		X	X	X	X		
Apron Conveyors	X						
Slat Conveyors	X						
Scraper Flight	X	X	X		X	X	X
Cross Bar	X						
Trolley and Tow						X	X
Pusher Chain	X	X	X	X	X		X
Carrier Chain	X						

Roller Conveyor Chain Selection Guidelines

Table 3 — General Characteristics of Conveyor Chain Types

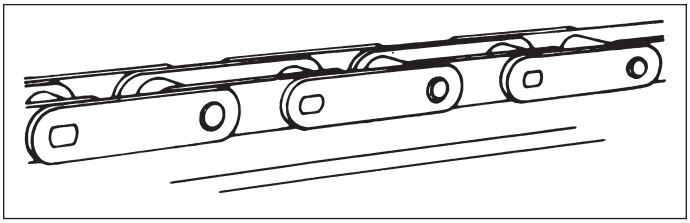
Chain Type	Pitch Range (in.)	Weight Range (lbs./ft.)	Working Loads (lbs.)	Operating Speeds (fpm)	Wear Life Rating
Roller Conveyor	1.654 to 24.0	3.7 to 35.0	2,100 to 22,300	10 to 200	A
Steel Bushed	2.609 to 7.0	3.8 to 67.0	2,750 to 21,800	10 to 150	B
Welded Steel	2.609 to 6.05	4.0 to 30.0	3,000 to 15,300	10 to 100	C
Welded Drag	5.0 to 8.0	12.0 to 29.0	8,500 to 15,000	10 to 100	C
Cast Combination	2.609 to 6.05	3.6 to 16.3	2,340 to 10,400	10 to 75	D
Drop Forged	3.031 to 9.031	2.2 to 10.0	1,100 to 21,600	10 to 75	C
Bar/Pin	4.0 to 12.0 (Avg.)	5.2 to 33.0	—	10 to 50	C

Chain Rolling or Sliding



Chain Rolling

- Best suited when chain carries materials.
- Smoother operation, less pulsation.
- Less friction — allows longer centers, smaller motors, and lower operating costs.
- Less horsepower required.
- Not suited for “dirty” applications where foreign materials can jam rollers.



Chain Sliding

- Best suited when conveyor deck supports materials and chains carry, push, drag or scrape.
- Rugged construction — ideal for impact loadings.
- Greater horsepower required.
- Works well in “dirty” applications because this chain has fewer moving parts.

Roller Conveyor Chain Selection Guidelines

Friction Coefficients

Table 4 — Sliding Friction Coefficients (f_s)

	Dry	Lubricated
Chains on Steel Rail	.33	.20
Chains on Bronze	—	.15
Chains on Hardwood	.35	.25
Chains on UHMW Plastic	.25	.15
Cast Iron on Steel	.50	.30

Table 5 — Sliding Friction of Materials on Steel Troughs (f_s)

Material	Friction	Material	Friction	Material	Friction
Aluminum	.40	Coal, Bituminous, Run of Mine	.60	Lime, Ground	.40
Ashes Dry < 3"	.50	Coal, Bituminous, Slack, Dry	.50	Lime, Pebble	.50
Ashes Wet < 3"	.60	Coal, Bituminous, Slack, Wet	.70	Sand, Dry	.60
Bagasse	.40	Coke, Sized	.40	Sand, Foundry, Shakeout	.70
Beans, Whole	.35	Coke, Mixed	.60	Sand, Foundry, Tempered	.85
Cement, Portland	.65	Coke, Breeze	.65	Sawdust	.40
Cement, Clinker	.70	Cottonseed	.35	Stonedust	.50
Coal, Anthracite	.30	Grains	.40	Stone, Screened Lumps	.60
Coal, Anthracite, Run of Mine	.40	Gravel, Dry, Screened	.45	Stone Lumps and Fines	.65
Coal, Anthracite, Pea	.45	Gravel, Run of Bank	.60	Wood Chips	.40
Coal, Anthracite, Buckwheat	.55	Ice, Crushed	.20		
Coal, Bituminous, Sized	.55	Ice Cakes	.10		

Table 6 — Approximate Rolling Friction Coefficients (f_r)

Roller O.D.	Dry	Lubricated
1 1/2	.22	.16
2	.20	.15
2 1/2	.16	.12
3	.14	.09
4	.12	.08
5	.11	.07
6	.10	.06

Roller Bearing f_r = .05
Ball Bearing with hardened race f_r = .03

Specific Rolling Friction Coefficients (f_r)

$$f_r = \frac{d}{D} f_s$$

Where:

D = O.D. of chain roller (in.)
d = O.D. of chain bushing (in.)
f_s = Sliding friction coefficient from Table 4

Roller Conveyor Chain Selection Guidelines

Table 7 — Maximum Speeds of Conveyor Chains (fpm)

All dimensions are in inches unless otherwise indicated.

Number of Teeth	Pitch				
	4	6	9	12	18
6	180	145	120	105	85
7	210	170	140	120	100
8	240	195	160	140	115
9	270	220	180	155	125
10	300	245	200	175	140
11	330	270	220	190	155
12	360	295	240	205	170
13	390	320	260	225	185
14	420	345	280	240	200
15	450	365	300	260	210

For economical speeds when conveyors are heavily loaded and the load is carried over the terminal sprockets use 75% of above values.

Table 8 — Allowable Roller and Bushing Bearing Pressures

Roller and Bushing Materials	Allowable Bearing Pressure (PSI)	
	Dry	Lubricated
Case Hardened Steel and Case Hardened Steel	700	1,400
Case Hardened Steel and Through-Hardened Steel	700	1,400
Case Hardened Steel and Untreated Steel	500	1,200
Case Hardened Steel and Chrome Iron	500	1,100
Case Hardened Steel and Chilled Iron	600	1,000
Case Hardened Steel and Bronze	200	400
Case Hardened Steel or Stainless Steel on Plastic	100	150

Engineering Formulas

Material Weight per ft. on Conveyor (M) for Bulk Materials (lbs./ft.)

$$M = \frac{(33.3)\ (Q)}{S}$$

$$M = \frac{(CFM)\ (d)}{S}$$

Where:

Q = Capacity (tons/hr.)

S = Chain speed (ft./min.)

CFM = Capacity or conveyed material flow rate ($ft.^3$/min.)

d = Material density ($lbs./ft.^3$)

Chain Speed (S)

$$S = \frac{(P)\ (N)\ (RPM)}{12}$$

Where:

S = Speed (ft./min.)

P = Chain pitch (in.)

N = Number of teeth in sprocket

RPM = Rotational speed of sprocket

Horsepower (HP)

$$HP = \frac{(t)\ (rpm)\ (1.1)}{63{,}025}$$

$$HP = \frac{(T)\ (rpm)\ (1.1)}{5{,}252}$$

$$HP = \frac{(P)\ (S)\ (1.1)}{33{,}000}$$

Where:

t = Torque transmitted by headshaft (in./lb.)

T = Torque transmitted by headshaft (ft./lb.)

rpm = Speed of headshaft

P = Total conveyor pull (lbs.)

S = Chain Speed (ft./min.) (Note: 1.1 compensates for motor efficiency.)

Estimated Chain Weight for Selection (lbs./ft.*)

- For Chain Rolling: Chain Weight = (.002) (M) (C)
- For Chain Sliding: Chain Weight = (.004) (M) (C)

Where:

M = Weight of material being conveyed on conveyor (lbs./ft.)

C = Center distance between sprockets

* = Weight of each strand without slats

To locate compatible sprockets for your chain, refer to the Product Cross-Reference at the back of this section.

Note: Dimensions are subject to change. Contact Tsubaki Technical Support to obtain certified prints for design and construction.

Roller Conveyor Chain Selection Guidelines

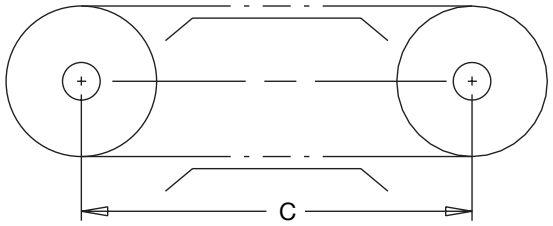
Conveyor Chain Pull Formulas

Horizontal

Material Carried: $P = (2.1W + M) f_r C$
(Slat or Apron Conv.)

Material Sliding: $P = (2.1Wf_S + Mf_S) C + J$
(Drag or Scraper Conv.)

Horizontal



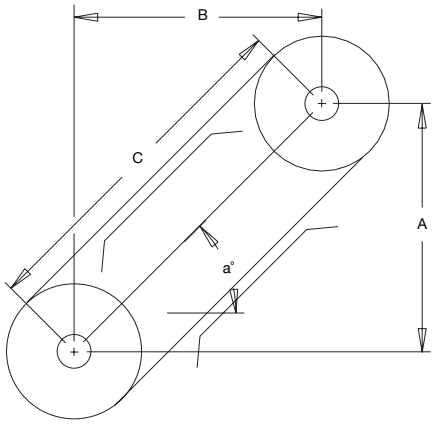
Inclined

Material Carried: $P = [(M + W) f_r COSa + (M + W) SINa] C + (Wf_r COSa - WSINa) C + J$
(Slat or Apron Conv.)

Material Sliding: $P = [(Mf_S + Wf_S) COSa + (M + W) SINa] + J$
(Scraper Conv.)

Note: When $(Wf_r COSa - WSINa) C$ is positive, multiply quantity by 1.1 to account for tail shaft friction.

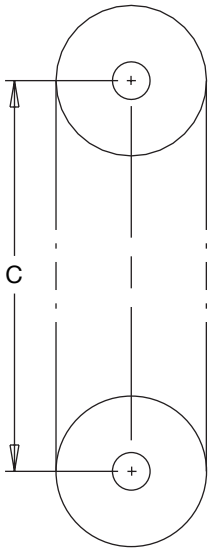
Inclined



Vertical

Material Carried: $P = (M + W) C + \frac{P_1}{2}$

Vertical



Glossary

- P = Total Conveyor Pull (lbs.)
- P_1 = Take-up Force (lbs.)
- W = Weight of chains, attachments, slats, etc., and other moving elements of the conveyor per ft. (lbs./ft.)
- M = Weight of material per ft. on the conveyor (lbs./ft.)
- f_r = Friction coefficient of chain rolling on support rail (Table 6)
- f_S = Sliding friction coefficient of material or chain sliding (Tables 4 and 5)
- C = Center distance (ft.)
- J = Pull (lbs.) caused by sideboard sliding friction (Table 9)

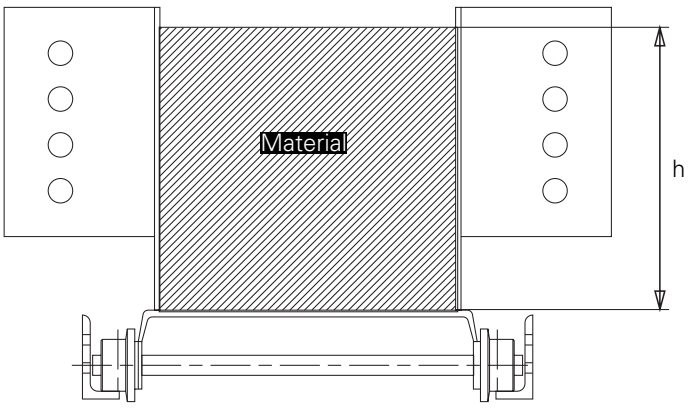
Table 9 — Additional Pull on Conveyor (J)
Material Sliding Against Sideboards

Material	R
Coal	14.0
Coke	35.0
Limestone	7.5
Gravel	7.0
Sand	5.5
Ashes	14.0

$J = \frac{Ch^2}{R}$ $SINa = \frac{A}{C}$

Where: $COSa = \frac{B}{C}$

h = Height of material in inches
R= Variable factor for different materials
C= Length of conveyor in feet



Roller Conveyor Chain Selection Guidelines

Selection Procedure

Step 1: Determine the Conveyor's Basic Requirements

- Type of conveyor to be used and layout of its dimensions (C, a, etc.).
- Type of chain including attachments.
- Determine weight of conveyed material (M) on the conveyor (lbs./ft.).
- Estimate weight of chain, attachments, and other moving parts of conveyor (W) (lbs./ft.).
- Friction Coefficients (Tables 4–6).
- Conveyor speed (S) (ft./min.).
- Determine pull due to sideboard friction (J).
- Determine service factor (V) from Table 10.

Step 2: Calculate Conveyor Pull

Use the appropriate formula from page C-49 to determine conveyor pull (P).

Step 3: Select Sprocket Size

Using Table 11, under conveyor speed read down to the number nearest 1.00 (this will be in the vicinity of the heavy dividing line). Read across to the left to obtain the optimum sprocket size. If space limitations require using smaller sprockets read across from the right from the number of teeth to the column under conveyor speed — obtain the Speed Correction Factor (E).

Step 4: Calculate Design Conveyor Pull (DP)

DP = (P) (V) (E)

Step 5: Calculate Chain Tensions (T)

- Single strand conveyor — T = DP
- Double strand conveyor — T = (DP) (1.2) /2
- Triple strand conveyor — T = (DP) (1.2) /3
- More than three strands — Contact Tsubaki Technical Support

Step 6: Select Chain Size

Choose a chain that has a maximum allowable load rating greater than the calculated chain tension of Step 5.

Step 7: Recalculate Actual Chain Tension

Repeat Steps 2–5 using actual chain weights. For roller conveyor chains, specific rolling friction coefficient values can be obtained from Table 6 on page C-47.

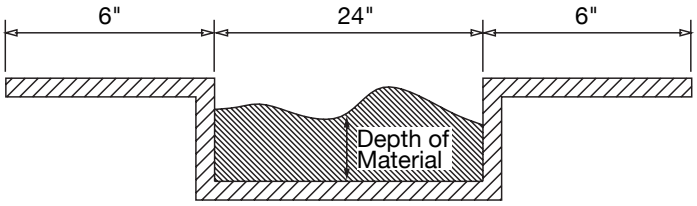
Step 8: Check Roller/Bushing Bearing Pressure (Roller Conveyor Chain Only)

Calculate bearing pressure from:

$$\text{Bearing Pressure} = \frac{\text{Maximum Load per Roller (lbs.)}}{\text{Bushing OD (in.) x Roller Length (in.)}}$$

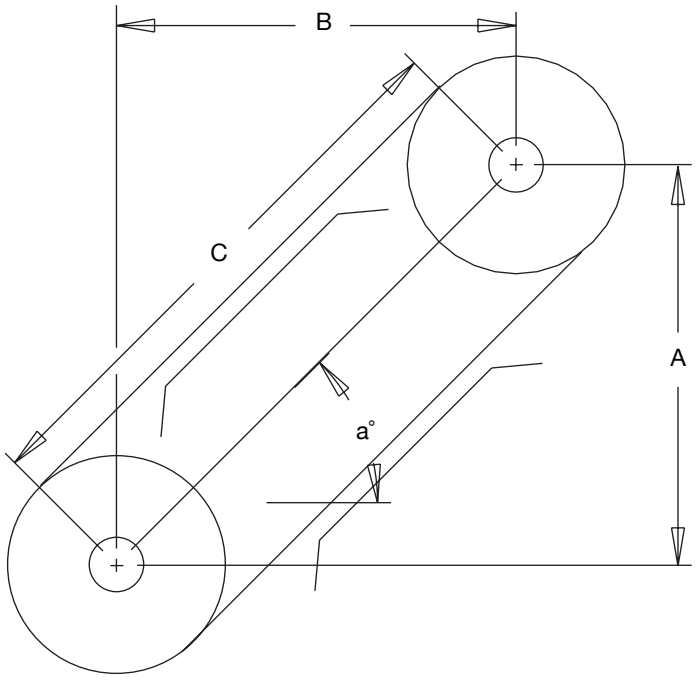
This value should be less than that shown in Table 8.

Selection Example



An incline scraper conveyor has been tentatively selected to handle bituminous coal. The sketch above shows the steel trough; other details are given below:

- Operating capacity: Q = 150 ton/hr.
- Operating speed: S = 100 ft./mn.
- Depth of material: d = 6"
- Total lift: A = 30 ft.
- Total horizontal run: B = 40 ft.
- Sprocket centers: C = 50 ft.
- Infrequent moderate shock
- 24-hour operation—"Dirty" conditions
- Scraper paddle: 5/16" x 12" x 23"—22.8 lbs. each, spaced every 12."
- Use roller conveyor chain



Roller Conveyor Chain Selection Guidelines

Selection Chain Pull Factors

Table 10 — Service Factors (V)

Frequency of Shock	Character of Conveyor Loading	Conditions of Operation	Daily Operating Period
Infrequent (1)	Uniform or Steady (1)	Relatively clean and moderate room temperature (1)	8–10 hours (1)[1]
	Moderate Shock (1.2)[1]	Moderately dusty (1.2)	
Frequent (1.2)[1]	Heavy Shock (1.5)	Unprotected from weather, dirty corrosive conditions or unusual temperatures within permissible operating range (1.4)[1]	24 Hours (1.2)

[1]Example V = 1.2 x 1.2 x 1.4 x 1.0 = 2.02

Table 11 — Speed Correction Factors (E)

All dimensions are in inches unless otherwise indicated.

	Conveyor Speed (ft./min.)														
Teeth	**10**	**25**	**50**	**75**	**100**	**125**	**150**	**175**	**200**	**225**	**250**	**275**	**300**	**400**	**500**
6	.92	1.09	1.37	1.68	2.00	2.40	2.91	3.57	4.41	5.65	7.35	10.60	16.70

8	.81	.91	1.04	1.16	1.26	1.37	1.49	1.63	1.76	1.93	2.10	2.29	2.48	3.62	6.21
9	.79	.87	.98	1.07	1.17	1.26	1.36	1.45	1.55	1.65	1.76	1.88	2.00	2.56	2.94
10	.78	.84	.94	1.02	1.09	1.16	1.24	1.31	1.37	1.45	1.53	1.61	1.68	2.03	2.41
11	.76	.82	.90	.97	1.03	1.09	1.15	1.22	1.28	1.34	1.40	1.46	1.52	1.78	2.05
12	.74	.79	.86	.93	.99	1.05	1.10	1.16	1.21	1.26	1.32	1.37	1.42	1.63	1.84
14	.74	.77	.83	.89	.94	.98	1.02	1.07	1.11	1.15	1.19	1.24	1.28	1.47	1.61
16	.73	.76	.81	.86	.89	.94	.97	1.01	1.05	1.08	1.12	1.16	1.19	1.34	1.48
18	.72	.75	.80	.83	.88	.91	.94	.98	1.01	1.04	1.08	1.11	1.14	1.27	1.40
20	.72	.75	.79	.83	.86	.89	.92	.95	.98	1.01	1.04	1.07	1.10	1.22	1.34
24	.71	.74	.77	.80	.82	.85	.88	.90	.94	.96	.98	1.01	1.04	1.15	1.26

Roller Conveyor Chain Selection Guidelines

Conveyor Selection Example

Step 1: Determine the Conveyor's Basic Requirements

- Incline scraper conveyor
- Roller conveyor chain with attachment for flight every 12".
- Determine (M) from formula on page C-48.

$$M = \frac{33.3\ (Q)}{S} = \frac{33.3\ (150)}{100}$$

$M = 50$ lbs./ft.

- Determine W:

$W = (CW)\ (N) + Ws$

CW = Wt. of Chain (lbs./ft.)
N = No. of chain strands = 2
Ws = Wt. of slats = 22.8 lbs./ft.

From formula on page C-47.

For Chain Rolling	For Chain Sliding
CW = .002 (M) (C)	CW = .004 (M) (C)
CW = .002 (50) (50)	CW = .004 (50) (50)
CW = 5.00 lbs./ft. (very light duty rolling)	CW = 10.00 lbs./ft. (sliding)

From Table 3 note that minimum chain weight = 3.70 lbs./ft., so use the 5.00 value rather than the 3.70 (lbs./ft.)

For Chain Rolling	For Chain Sliding
W = (5.00) (2) + 22.8	W = 10.00 (2) + 22.8
W = 32.8 lbs./ft. (rolling)	W = 42.8 lbs./ft. (slide)

Friction Coefficients
From Table 5:

$f_s = .55$ (Sliding Coal)

From Table 6:

$f_r = .20$ (Rolling Chain)

- Conveyor Speed:

(s) = 100 ft./min.

- Determine Sideboard Friction (J) from Table 9:

$$J = \frac{Ch^2}{R}$$

$$J = \frac{50\ (6)^2}{14}$$

$J = 128$ lbs.

- Determine Service Factor (V) from Table 10:

$V = (1.0)\ (1.2)\ (1.4)\ (1.2)$
$V = 2.02$

Step 2: Calculate Conveyor Pull (P)

From formula on page C-49.

For Chain Rolling

$P = [(Mf_s + Wf_r)\ COSa + (M + W)\ SINa]\ C + (Wf_r\ COSa - W\ SINa)\ C$
$P = [((50)\ (.55) + (32.8)\ (.2))\ .8 + (50 + 32.8)\ .6]\ 50 + [(32.8)\ (.2)\ (.8) - 32.8\ (.6)]\ 50$
$P = 3{,}850$ lbs. - 720 lbs.
$P = 3{,}130$ lbs. (rolling)

For Chain Sliding

$P = [(Mf_s + Wf_s)\ COSa + (M + W)\ SINa]\ C + (Wf_s\ COSa - W\ SINa)\ C$
$P = [(50)\ (.55) + (42.8)\ (.33)\ .8 + (50 + 42.8)\ .6]\ 50 + [(42.8)\ (.33)\ (.8) - 42.8\ (.6)]\ 50$
$P = 4{,}450$ lbs. - 720 lbs.
$P = 3{,}730$ lbs. (sliding)

Step 3: Select Sprocket Size

From Table 11 we obtain 12-tooth sprocket as best selection choice.

$E = .990$

Step 4: Calculate Design Conveyor Pull (DP)

For Chain Rolling	For Chain Sliding
DP = (P) (V) (E)	DP = (P) (V) (E)
DP = (3130) (2.02) (.99)	DP = (3,730) (2.02) (.99)
DP = 6,260 lbs. (rolling)	DP = 7,460 lbs. (sliding)

Step 5: Calculate Chain Tension

For Chain Rolling	For Chain Sliding
T = (DP) (1.2)/2	T = (DP) (1.2)/2
T = (6,260) (1.2)/2	T = (7,460) (1.2)/2
T = 3,760 lbs. (rolling)	T = 4,480 lbs. (sliding)

Step 6: Select Chain Size

For Chain Rolling

Referring to page C-32, the G-29 or G-19 attachments are convenient for bolting scraper flights. Since attachment spacing is every 12", choose either 4", 6", or 12" pitch chain.

Select 1131R with G-29 every 2nd pitch.

For Chain Sliding

Note that chain U-3945 with K-3 attachments every 3rd pitch could suit this application. In addition, mining industry chains should be considered. Choose the chain that offers the best overall economy.

Select U-3945 with K-3 attachments every third pitch.

Step 7: Recalculate Chain Tension

For Chain Rolling

W = 22.8 + 13.9

W = 36.7 lbs./ft.

f_r = .33 (1.125/3)

f_r = .12

DP = 2,960 (2.02) (.99)

DP = 5,920 lbs.

T = 5,920 lbs. (1.2)/2

T = 3,550 lbs./strand (rolling)

Since the maximum allowable working load rating of 1131R is 5,900 lbs., the selection is satisfactory. We could, however, economize by selecting a smaller chain (for example, 627R). To do this, recalculate chain tension by repeating Steps 2, 3, 4, and 5.

For Chain Sliding

W = 22.8 + 9.8

W = 32.6

f_s = .33 (Sliding Steel)

f_s = .55 (Sliding Coal)

DP = 3,720 (2.02) (.99)

DP = 7,440 lbs.

T = 7,440 lbs. (1.2)/2

T = 4,460 lbs./strand (sliding)

Since the maximum allowable working load rating of U-3945 is 5,740 lbs., the selection is satisfactory. If bolted flight attachments are not necessary, mining industry chain could be considered.

Steel Bushed Chain

Tsubaki Steel Bushed Chains are specially designed and manufactured to provide excellent service in severe working conditions. Our chains are manufactured to close tolerances with the most modern equipment in the industry.

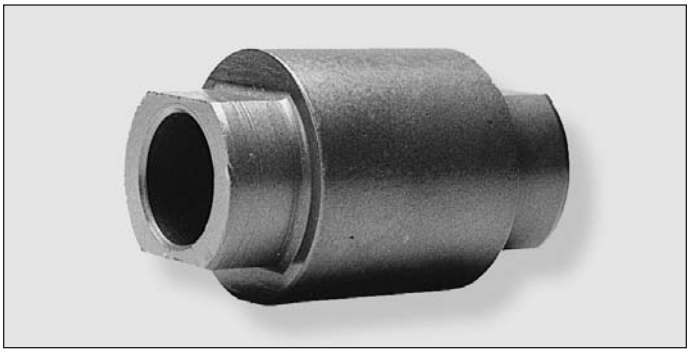
Each component is made from high-quality steels and then specially heat-treated to provide maximum performance and long wear life. Joint parts are hardened to provide greater strength and wear resistance. Sidebars are hardened to achieve ultra-high strength throughout.

Specify Tsubaki Steel Bushed Chains when the system operates under gritty or abrasive conditions, such as bucket elevators and other challenging conveyor applications. Tsubaki Steel Bushed Chains are also used to replace combination chains when installations are modified to handle heavier loads or operating conditions become more severe.

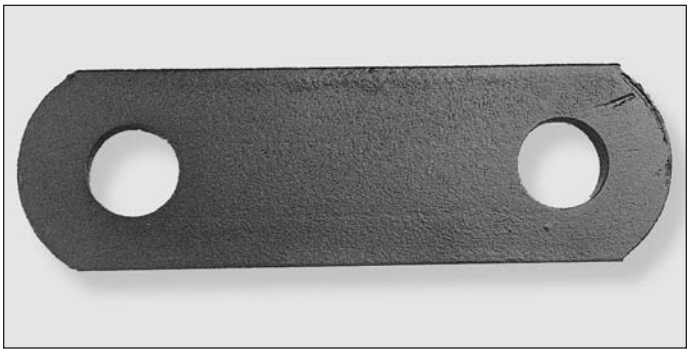
Steel Bushed Chain Components

Strong, Tough Pins
Pins are made of select alloy steel or high-quality carbon steel. They are hardened to achieve superior strength and extend wear life. This creates the ideal combination of surface hardness for wear resistance and core toughness to resist impact.

Long-Wearing Bushings
Bushings are manufactured to rigid specifications for optimum wear resistance and strength. Select steels are precision machined to maintain consistently high sidebar interference. This results in positive sidebar hold and favorable residual stress to resist fatigue. Bushings are case-hardened and heat-treated to extend the wear life.



Fatigue-Resistant Sidebars
Sidebars are through-hardened to achieve ultra-high strength. This keeps the chain hanging failure-free, ensuring consistent service life. Tsubaki has developed superior techniques to ensure hole quality and pitch control. The result is fatigue resistance and premium performance.



Steel Bushed Chain

Drop Forged Rivetless Chain

Drop Forged Rivetless Chain has widespread use in many industries on trolleys, scraper flights, assembly and similar conveyors. Because materials do not tend to pack in its open structure, the Drop Forged Rivetless Chain is used extensively for flight conveyors. Its design permits both horizontal and vertical operation over irregular routes, making it particularly acceptable for trolley conveyor service. Related chain products and accessories are Barloop Chain, trolleys, drive dogs and Caterpillar Chain.

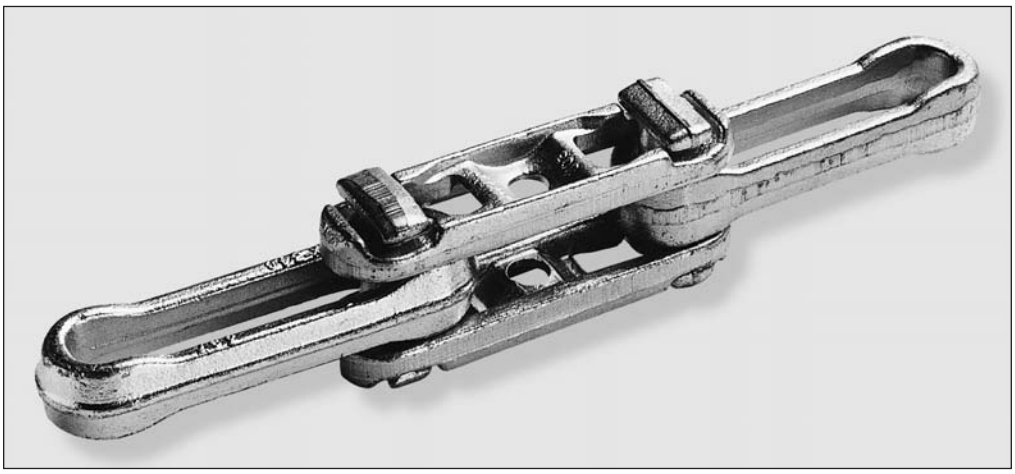
Component hardness: BHN 344 (Nom.) = Carbon steel chains; BHN 380 (Nom.) = Alloy steel chains.

[1]ANSI/SAE 8642

[2]The prefix "X" designates a design proportioned to flex transversely on a shorter radius. The outside bars are made with a mid-pitch panel that strengthens the sidebar and prevents material from falling through the link. X-Styles are used on overhead conveyors and other special applications. Attachments shown on the following pages fit both Standard and X-Style Chain.

UWL Drop Forged Rivetless Chain

UWL Drop Forged Rivetless Chain

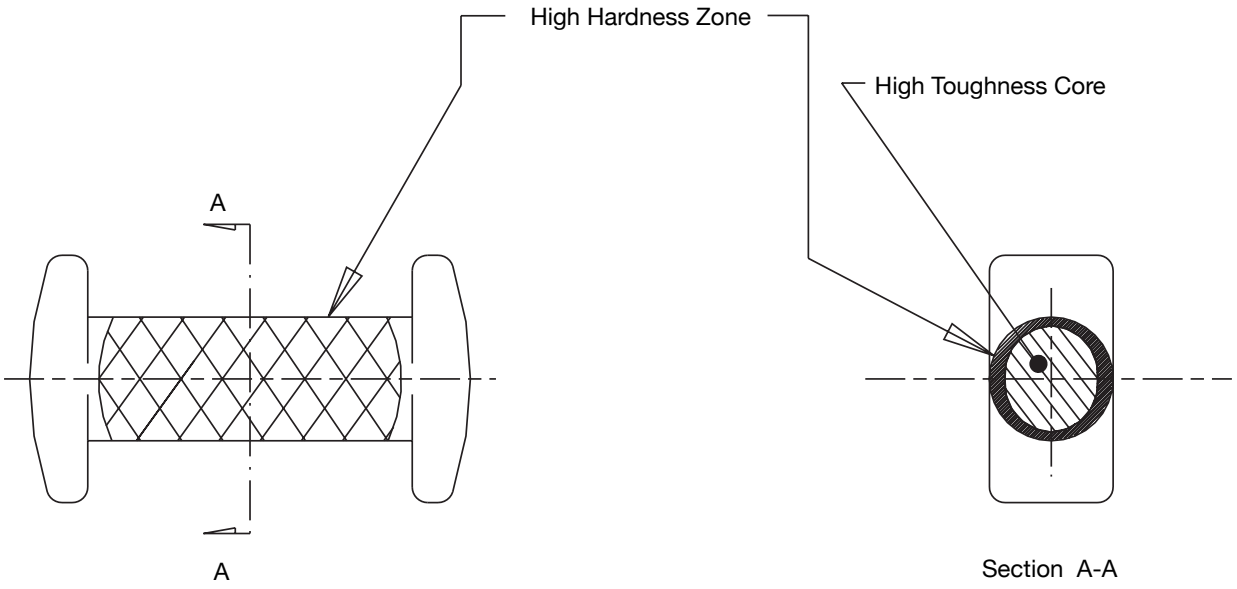


UWL (Ultra Wear Life)

Drop Forged Rivetless Chains

Ultra Wear Life Drop Forged Rivetless Chain extends wear life of rivetless chain. Tests under real-life conditions have proven that UWL chain lasts 40 to 50 percent longer than ordinary rivetless chain. This extraordinary performance has been achieved with special steels and a proprietary pin hardening process. Since pin wear is the major limiting factor with rivetless chain, Tsubaki's specially produced pins greatly increase the chain's wear life. UWL Drop Forged Rivetless Chain is available in X-348, X-458, X-678, 698 and barloop styles.

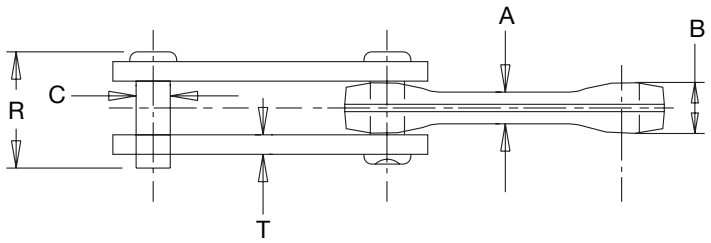
Higher Hardness Pin for "Ultra Wear Life" Performance

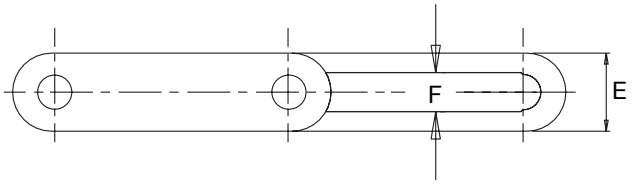


Drop Forged Rivetless Barloop Chain

Barloop Chains

A solid side bar chain with standard rivetless chain center links and hardened wear surfaces to assure long life in sliding applications. Barloop Chains consist of a standard forged rivetless inside block, fabricated steel sidebars, and cold drawn steel pins. Barloop Chain offers the advantage of a flat sidebar for welding attachments. The pin is securely locked in the sidebars eliminating both the wear between the pin and sidebar and the possibility of the chain coming apart when slack exists. Tsubaki offers Barloop Chain with a nut and bolt assembly that rotates. This permits easy assembly and quick replacement.





Barloop (Bar Link) Chains

All dimensions are in inches unless otherwise indicated.

Chain Number	Pitch	Dimensions							Average Ultimate Stgth.(lbs.)	Average Pitches per Foot	Approx. Weight (lbs./ft.)

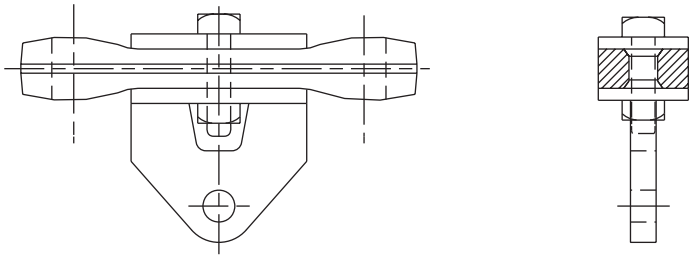
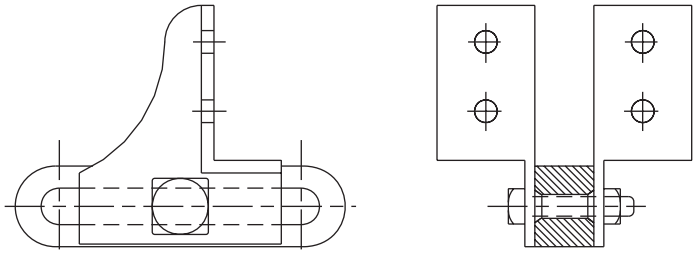
The following are examples of additional attachments available with Drop Forged Rivetless Chain. Attachments are also available for special applications.

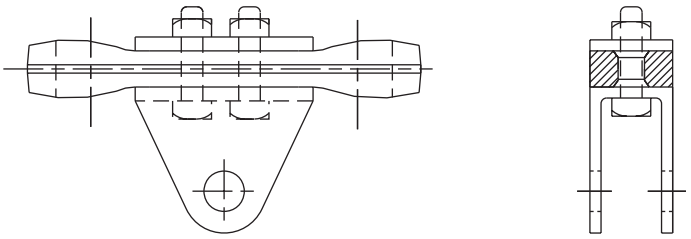
A-22 Attachment



F-2 Attachment

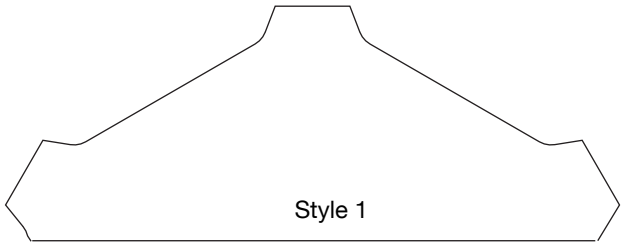


A-53 Attachment



Sprockets for Drop Forged Rivetless Chain

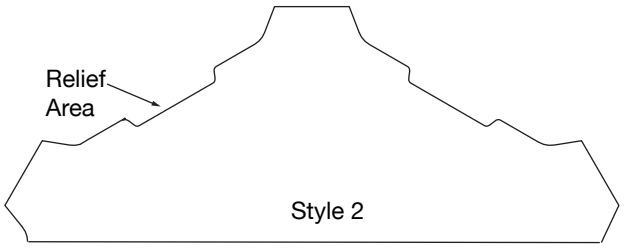
Drop Forged Rivetless Sprockets are designed to work with the chain and attachments. Some setups, such as slider attachments on overhead slaughter house lines, require extra clearance that is not part of standard sprocket construction (Style 1).



Standard sprockets are not designed for some applications like overhead slaughter house lines where the attachment requires extra clearance.

Our specially developed sprocket (Style 2) has a “relief area”. This keeps the chain from riding out of the sprocket pocket and reduces premature joint wear.

Select the right sprocket for your application. Contact --- Chain if you have any questions.



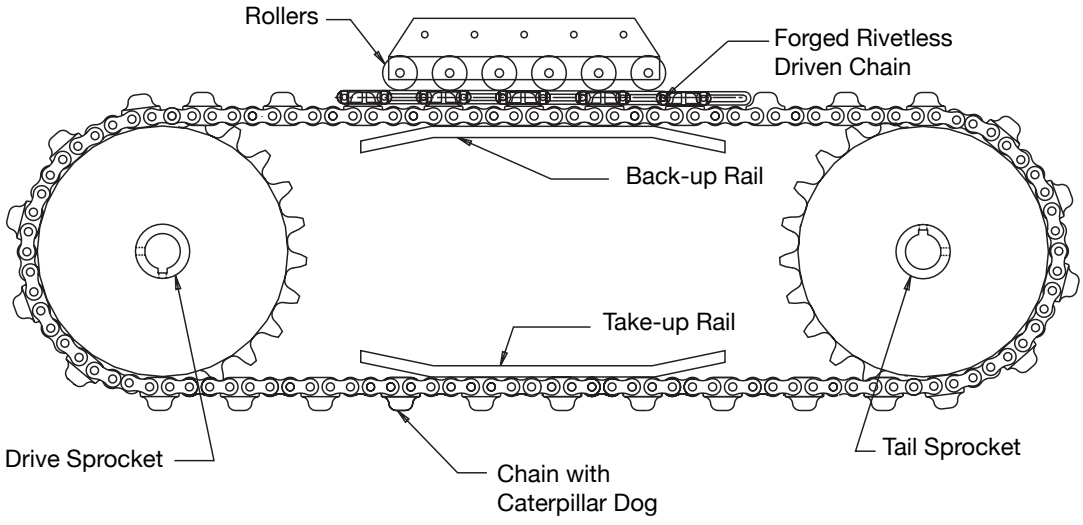
Drop Forged Rivetless Sprockets from Tsubaki have a “relief area” that allows for attachment protrusion. This means better articulation and longer wear life.

Drop Forged Rivetless Chain (Caterpillar Drive)

Caterpillar Drive (Power) Chains

Caterpillar Drive Chains are chains with pushers used to drive drop forged chain. They are vital in driving drop forged chain conveyors, so they must deliver fatigue-free operation. The Tsubaki Caterpillar Drive Chain features high-quality roller chain with drive dogs made of one-piece forged, induction-hardened steel. The entire assembly is designed to operate flawlessly in combination with our forged rivetless chain. Our chain also meets ANSI standards.

Power Chain

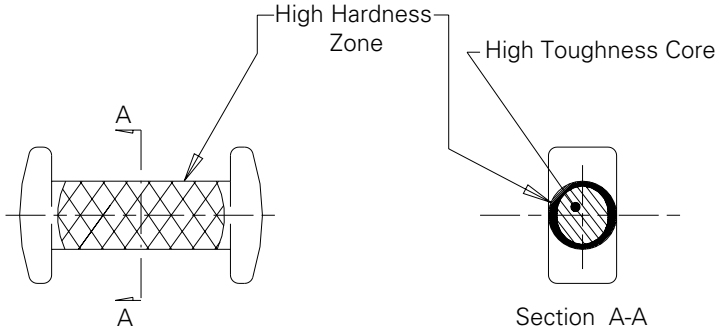


Drop Forged Rivetless Chain (Caterpillar Drive)

UWL-Drop Forged Rivetless Chains

Ultra Wear Life Drop Forged Rivetless Chains are innovative products that extend wear life of rivetless chain 40 percent or more. This extraordinary performance is achieved with special steels and a special pin hardening process. That means significant savings of time and money, by reducing maintenance and changeout costs, decreasing downtime, and lowering repair bills.

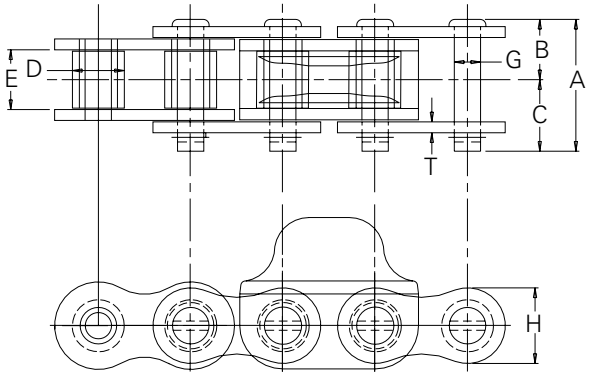
Higher Hardness Pin for "Ultra Wear Life" Performance



Caterpillar Drive (Power) Chains

Caterpillar Drive Chains must deliver fatigue-free operation. Every part of Caterpillar Drive Chain from TsubakI is top of the line. The roller chain is high-quality, with many drive dogs made of one-piece forged, induction-hardened steel. Special, made-to-order caterpillar chains are also available. The entire assembly is designed to operate flawlessly in combination with Drop Forged Rivetless Chain.

Caterpillar Drive Dog



Caterpillar Drive Chain

To locate compatible sprockets for your chain, refer to the Product Cross-Reference at the back of this section.

Note: Dimensions are subject to change. Contact Tsubaki Technical Support to obtain certified prints for design and construction.

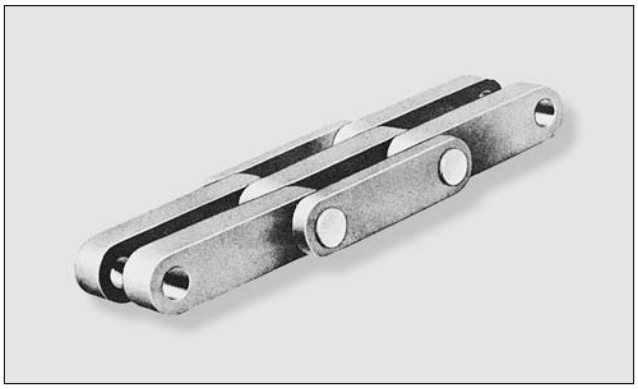
Bar and Pin Chain

Bar and Pin Chain is designed for economical applications/installations where the speed is relatively slow and/or heavy load lifting is needed. It can be used in the steel industry for cooling high-temperature steel bars, seamless pipes, or for pushing red-hot slabs and billets. In addition to the steel industry, Bar and Pin Chain is used for vertical conveyance of sand and earth, and for shuttle traction.
Construction and Features This chain is usually composed of three parts: two outer plates and one (or sometimes two) inner plate (block) that are connected with pins. The tensile strength ranges from 309 to 2,720 kN.
In comparison to roller chain, Bar and Pin Chain has the following features:

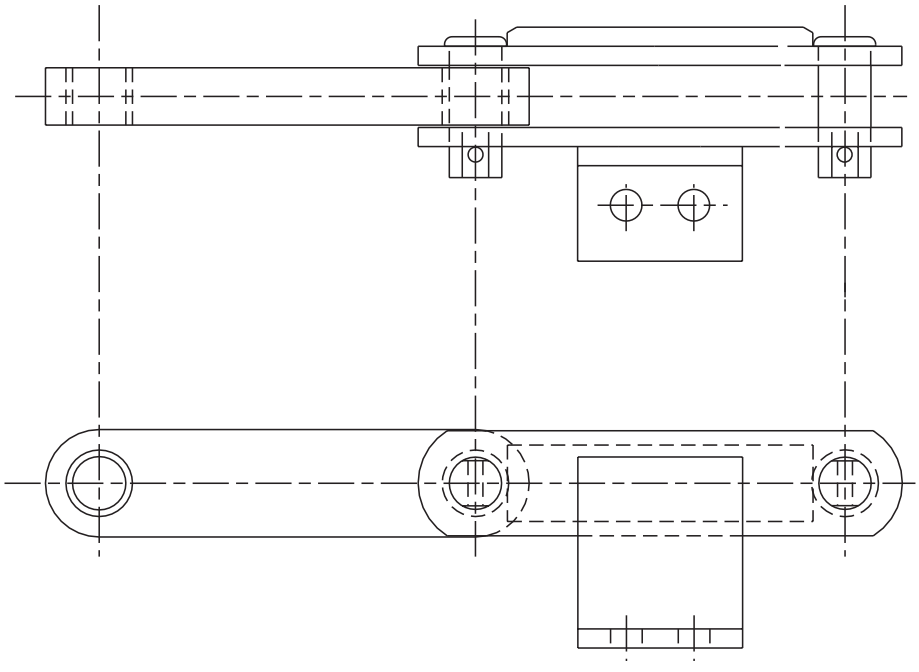
(1) Greater impact resistance due to the strong construction and high rigidity.
(2) Higher strength considering chain weight.
(3) All the main parts are heat-treated for greater wear resistance against the guide rails.
(4) Usually the bottom side of the plate slides on the guide rail; the chain does not have rollers.

Conveyed objects can be pushed/carried on the guide rails using special pushers (dogs) attached to the chain. Sprocket teeth engage the inside plate of the chain, entering the area between outer links. The sprocket skips every second tooth to allow for the solid block.

A few standard styles are illustrated. The bar and pin chains are normally manufactured on a made-to-order basis. Our engineering and design services provide maximum flexibility, allowing us to create the right chain with the right attachments for your application.



Bar and Pin Type Scraper Reclaimer Chain with A-2 Attachment



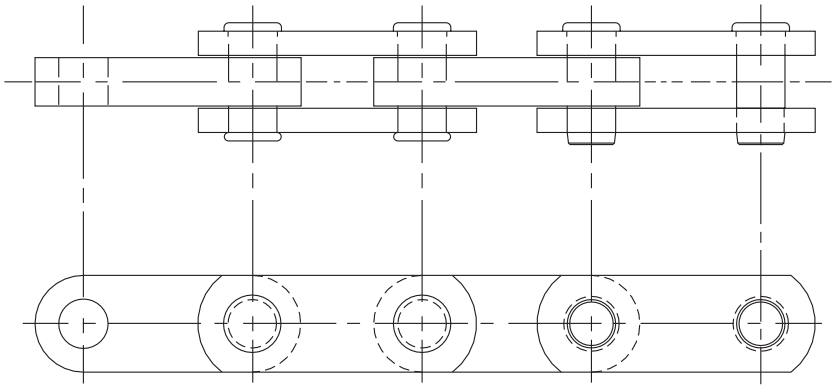
Draw Bench Chain
Bar and Pin Chain

Draw Bench Chains

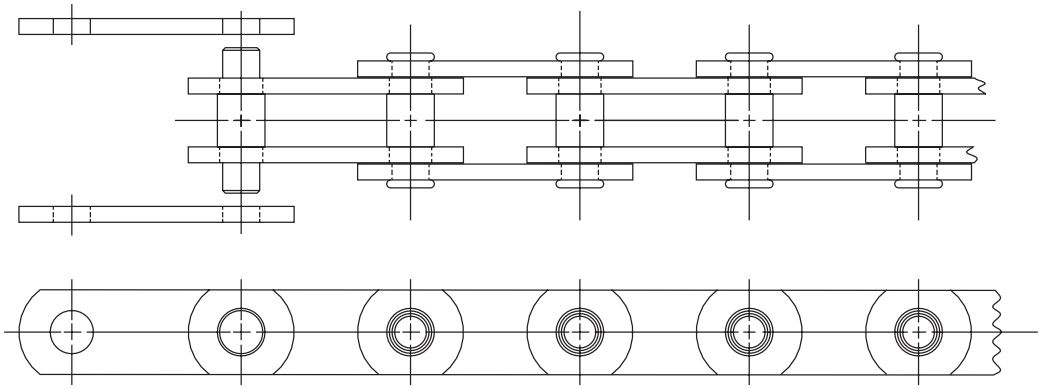
The primary metals and steel industries rely on draw bench chain to meet their specific metal drawing requirements. Tsubaki manufactures a wide range of sizes, materials, and ultimate strength ratings up to 1,000,000 pounds. Tsubaki Draw Bench Chains are manufactured on a made-to-order basis. Our Technical Support staff work closely with you to select and design the draw bench chain that meets the requirements of your specific application.

Style 1

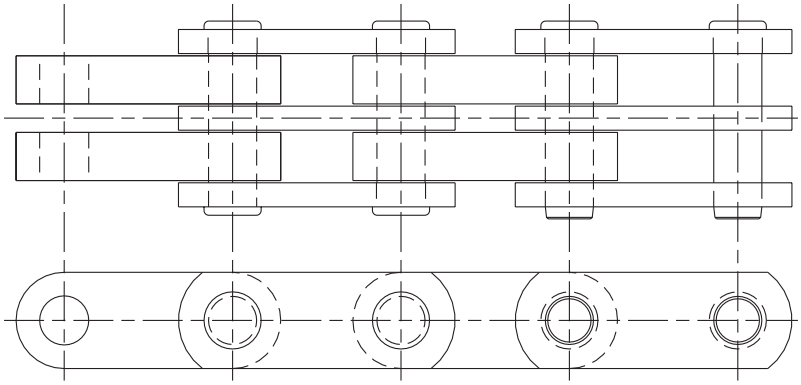
Double Flex Chains



Style 2



Style 3



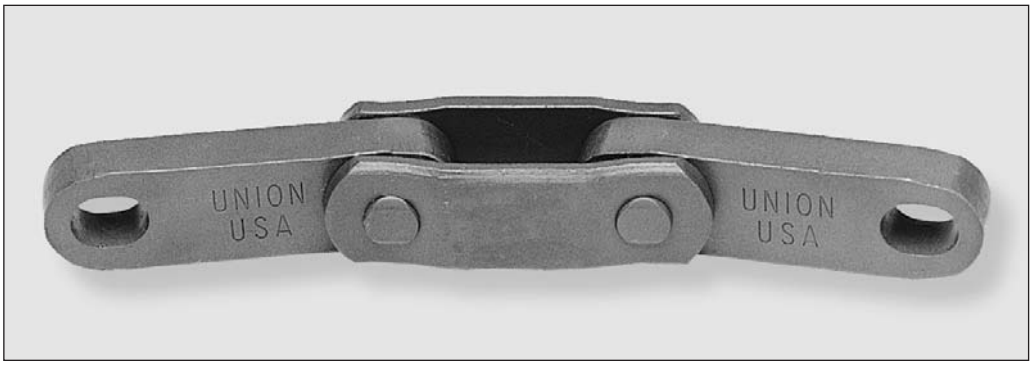
Double Flex Chain Bar and Pin Chain

Double Flex Chain (or dairy case conveyor chain) rotates on two planes, making it an ideal choice for a wide variety of applications. The pin bearing surfaces and selected sliding surfaces are induction hardened for extended wear life.

The Double Flex Chain offers a large sliding area to decrease shear on the chain and the sliding surface because design allows maximum flexibility for both horizontal and vertical movement.

This versatility allows compact layouts and economical cost. The mechanically designed cupped shape of the outer link plates of DF-3500 and DF-3910 eases side flex movement and protects rivet ends. This feature also prevents pin wear at the ends. DF-3498 offers flexibility with straight outer link plates.

The drawings shown are examples of just a few double flex chain styles. Many additional styles and configurations are available on a made-to-order basis. Sprockets are also available — split, solid, or bronze bushed.



Ratio of Chain Speed (FPM) to Conveyor Length (ft.)	Maximum Allowable Working Load (lbs.)
0.1–0.6	4,000
1.0	3,400
1.5	2,900
2.0	2,600
2.5	2,300
3.0	2,100
3.0–15.0	2,100

For ratios less than 0.1 or more than 15.0, contact Tsubaki Technical Support for suggested working load.

Double Flex Chain

[1]Working load for speed length ratio V/S up to 0.6., where V = chain speed (ft./min.) and S = conveyor length (ft.). For other speed length ratios, see Table 1.

To locate compatible sprockets for your chain, refer to the Product Cross-Reference at the back of this section.

Note: Dimensions are subject to change. Contact Tsubaki Technical Support to obtain certified prints for design and construction.

Engineering Class Chain
Selected Industry Applications

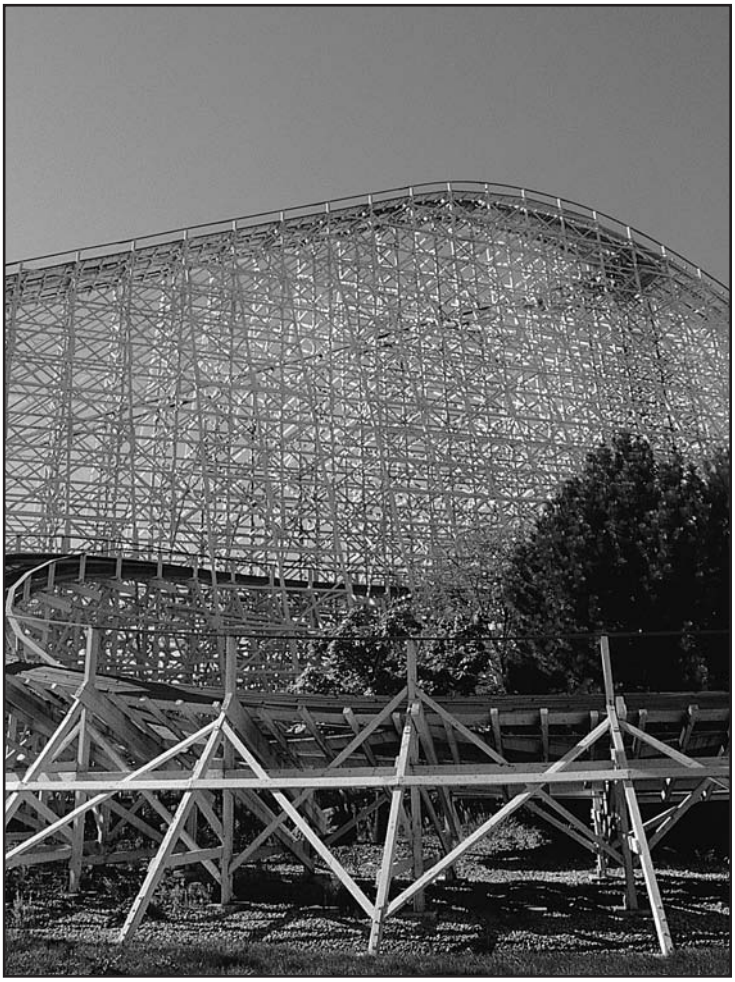
Count on Tsubaki chain and sprockets to provide the right solution for your application.

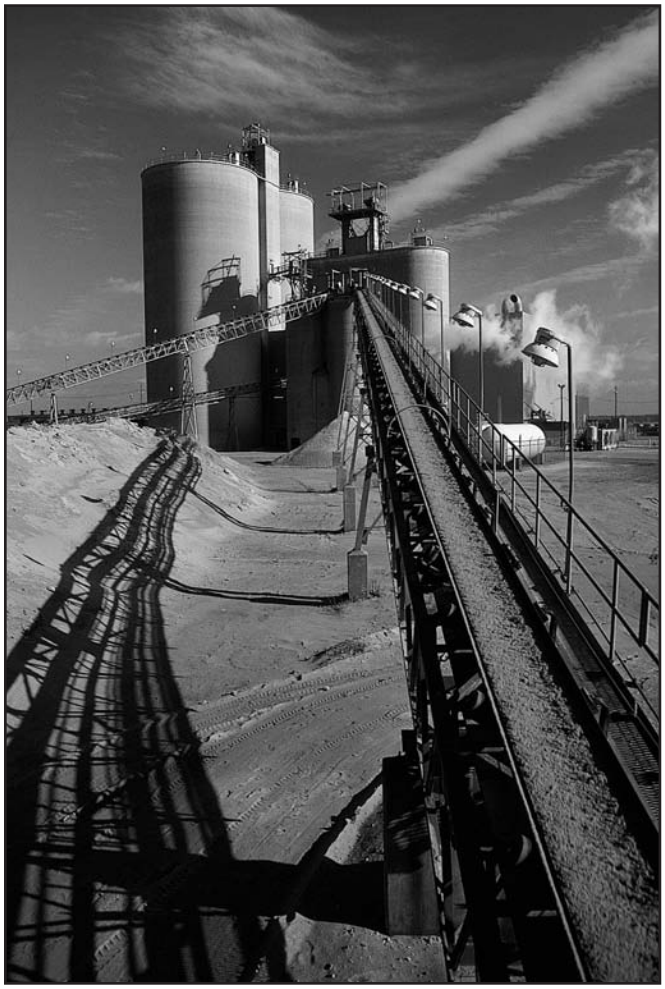
You've got to keep production moving without unplanned shutdowns. In today's competitive marketplace, line breaks are expensive. Downtime... repairs... damaged product on-line at the time of the break... they come right off your bottom line.

Reduce your risk with heavy-duty engineering class chains and sprockets from Tsubaki.

Tsubaki builds the most reliable chain products for your heavy-duty application. That means you get real value for your investment. With Tsubaki, you have a qualified, reliable, single source for dependable heavy-duty chains and sprockets.

Whether you are an original equipment manufacturer or you want to revitalize equipment at your plant, Tsubaki has the products you need.





Amusement Parks

Tsubaki brings fun – and safety – to amusement parks across the United States and Canada. We are the preferred supplier for hundreds of parks and a member of the Amusement Industry Manufacturers & Suppliers (AMIS) International. This helps us keep abreast of the strict requirements with today's safety and quality standards.

Tsubaki Amusement Park Chains and Sprockets are individually designed to ensure maximum strength and durability. This is of the utmost importance in an application like this where safety and reliability are paramount. We use rigorous quality assurance procedures, including dimensional measurements, metallurgical analysis and hardness testing.

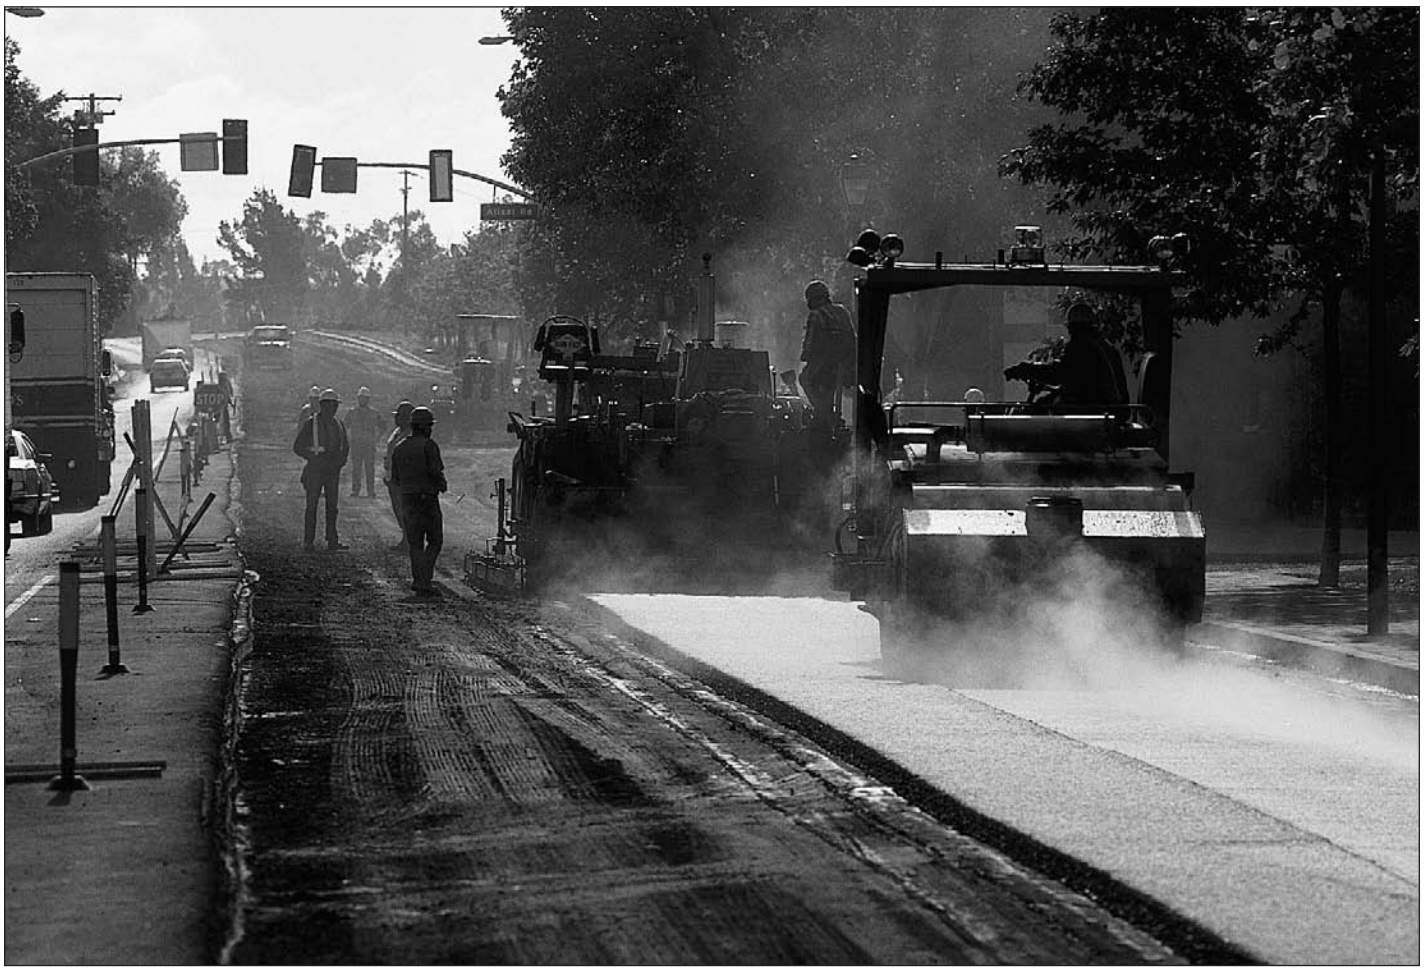
Amusement Park Chains and Sprockets are individually manufactured and tested on a made-to-order basis to meet your exact specification. Please note that an indemnification agreement may be required prior to the sale of Amusement Park Products. Contact Tsubaki Technical Support with details of your rides and let us select the best products to meet your needs.

THE TSUBAKI SOLUTION

- Strong, long lasting chain and sprockets.
- Handles shock loads.
- Reliable service.
- Weather and water resistant.
- Quality manufacturing at every step.
- Made to your exact specifications.

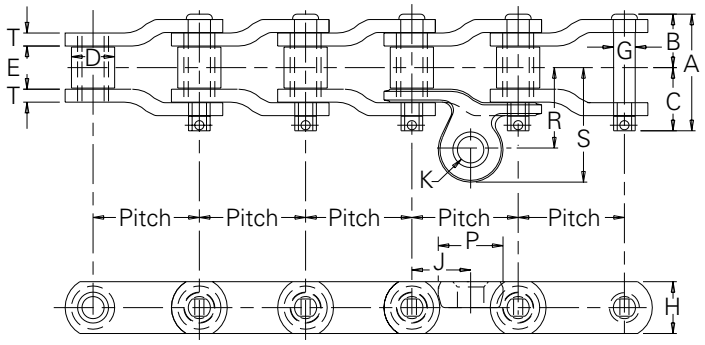
Asphalt Batch Plants and Finishing

We make a variety of chains for the asphalt and paving industry. The combination of hard aggregates, asphalt, and the necessity to run almost continuously during the paving season calls for tough chains with long wear life.



Paving Machines

When hot asphalt arrives at a road construction site, the mix flows from dump trucks into the paving machine hopper. An asphalt paving machine uses a special scraper conveyor to transfer hot asphalt from the hopper to the road surface. We have designed chains specifically to fit O.E.M. equipment and to function in this hot, abrasive environment.



Paver Chains

All dimensions are in inches unless otherwise indicated.

Asphalt Batch Plants and Finishing

Asphalt Plants

Three types of chains are typically used in asphalt plants:

- Inclined Scraper Conveyor Chains are used to move the asphalt mix into storage hoppers.
- Drive Chains are used on rotating drums to mix the aggregate and asphalt.
- Bucket Elevator Chains are used to move aggregates to storage silos and are sometimes used to move the asphalt mix to storage hoppers.

Tsubaki supplies Inclined Scraper Conveyor Chains in 4" to 6" pitch with both K- and slotted-M-style attachments. These chains are designed and constructed to give the best combination of strength and toughness. The chains are balanced to ensure continued safe operation. Sidebars are hardened to resist the impact loading that may occur. Rollers are specially heat-treated to resist outside diameter abrasion inherent in asphalt conveyors. These special features make our chains long-lasting and keep your operation running smoothly.

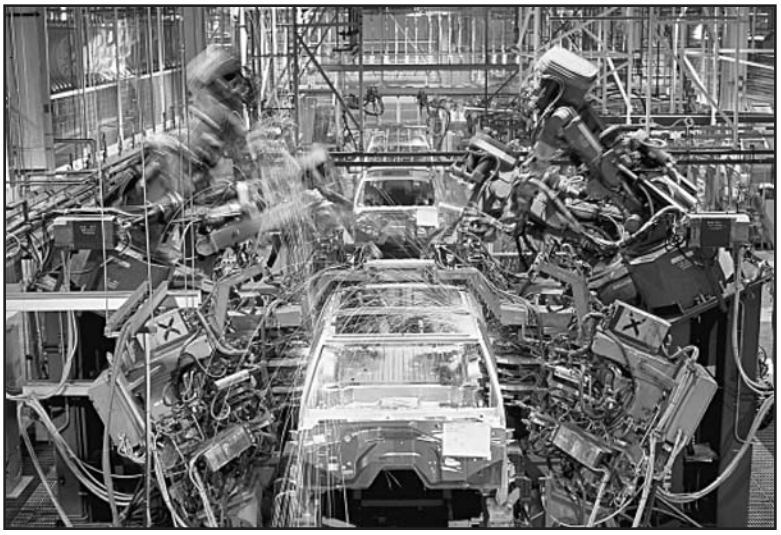
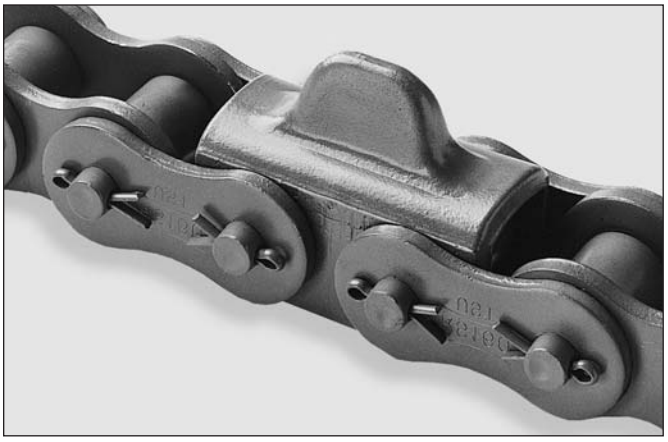
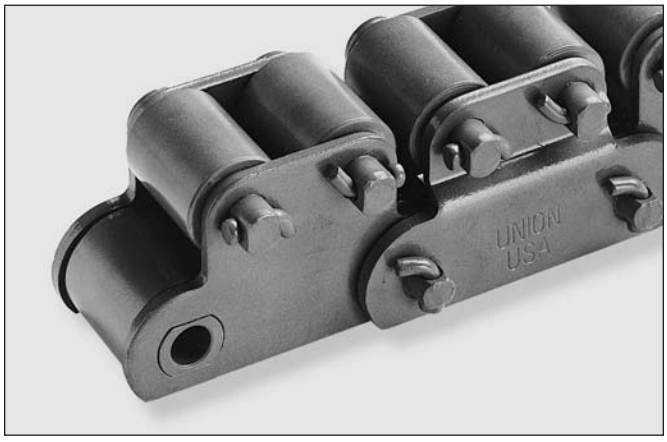
Automotive Industry

Tsubaki is a partner of the automotive industry. Our chains are found in plants throughout North America. Only Ts offers such a wide selection of chain sizes, types and configurations. Tsubaki can offer both standard and custom made-to-order chains to suit many applications. Tsubaki delivers added value and longer service life for your heavy-duty applications.







Bottling Industry

Tsubaki keeps the beverages flowing at breweries, soft drink bottlers, and juice manufacturers throughout the world. We make chain that is used in bottlewashers, pasteurizers, and sterilizers. There are hundreds of specifications and configurations that can be used in these applications, depending on the type and capacity of equipment, size of bottles, and many other factors. We have a wide range of chains available, or we can make a chain to your exact specifications.

Factors to Consider

Bottlewasher/Pasteurizer Chains are used to convey large quantities of bottles at a slow speed through the washer or pasteurizer. Chains are generally matched and tagged to hold bottle racks in exact position between chains without skewing. Chain and attachment tolerances are very important. Usually the chains are constructed of carbon steel for increased economy. Since the environment is wet, stainless steel or plated parts can be used to improve corrosion resistance. Chains can be almost any pitch size; however, they are
commonly in the 4" to 6" range. Attachments are usually mid-pitch holes or A styles, but may be made to fit your units. Sterilizers use two strands of chain. Bottles are sterilized by steam, which creates a wet, high-temperature environment (200˚F). That means chains must be constructed from temperature- and corrosion-resistant materials, such as stainless steel. Sterilizer chains frequently have a 4" to 6" pitch.

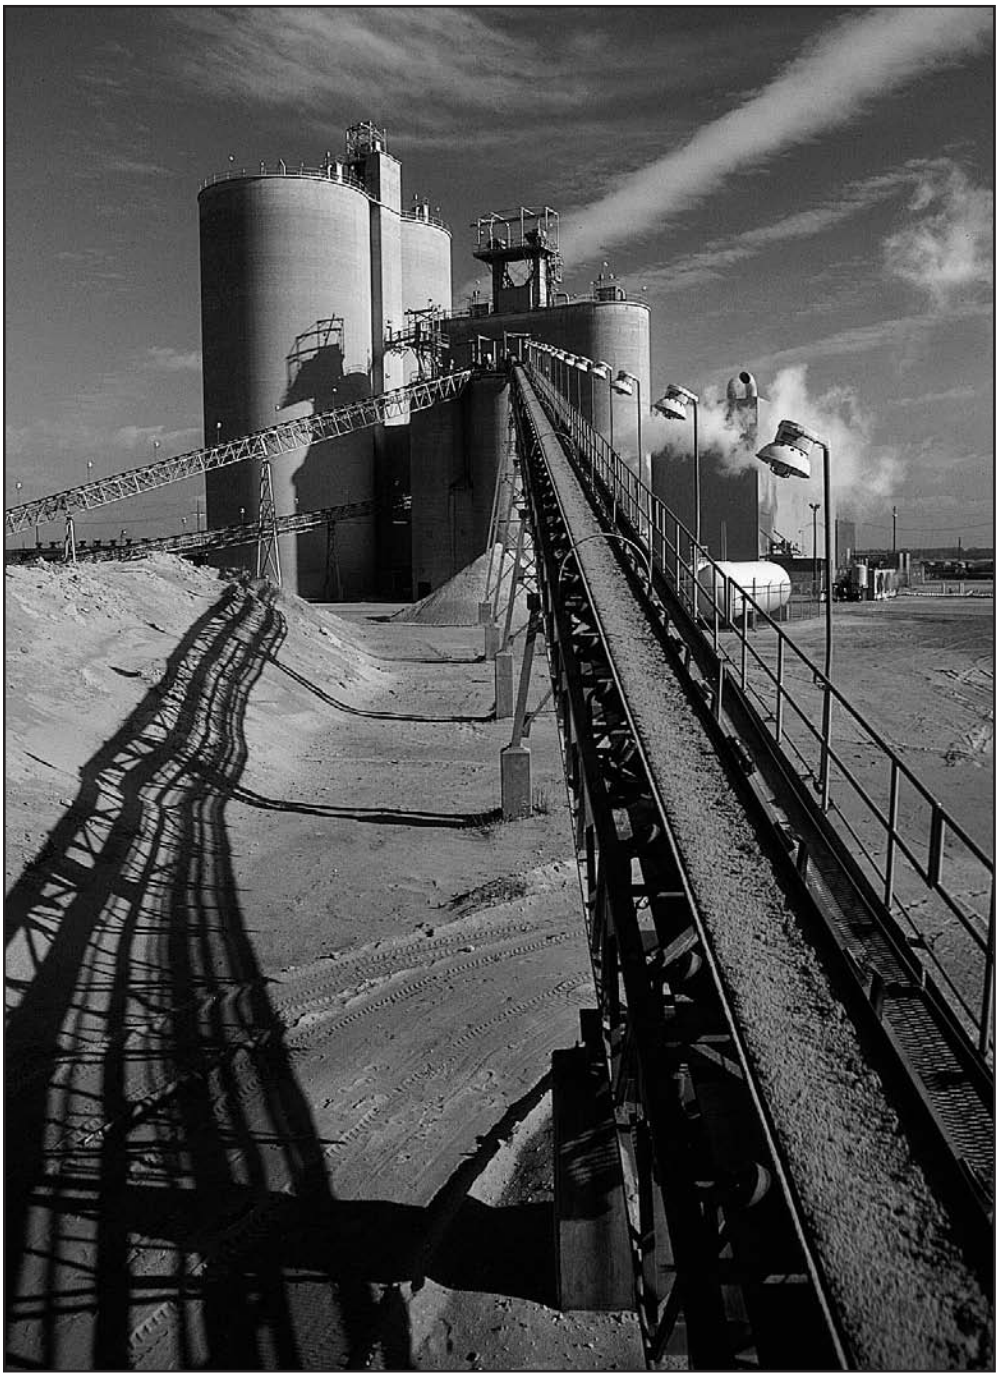
Cement Plants

Tsubaki Chain has developed a truly remarkable line of bucket elevator chains designed especially for service in cement plants. These chains provide the highest ultimate and fatigue strengths available for this application. In addition, our innovative barrier seal design in the 4000 Series Chains helps prevent abrasive materials from entering and attacking the chain joints.

We are so confident in our Cement Plant Elevator Chains that we offer an exclusive Three-Year Limited Performance Guarantee, which protects against breakage and excessive elongation due to wear.

Matching sprockets, designed expressly for use with the 4000 Series Chains, are also available. These include standard-size sprockets furnished with a minimum 58R (Rockwell C) tooth hardness. Sprockets with even greater hardness can also be ordered.



Maximum Strength

Tsubaki 4000 Series Chains are made of specially selected 100% alloy steel, and they possess ultimate strength ratings approximately 45% higher than competitive brands. A special piercing technique developed by Tsubaki makes exceptionally smooth pitch holes for high interference fits. This piercing method, combined with shot peening, yields maximum fatigue strength and protects against failure—even when chains are challenged by the most severe applications.

Tsubaki Builds the Strongest Chain

Chain Number	Average Tensile Strength	
	4000 Series	Competitor's Product
4856	145,000	100,000
4857	174,000	130,000
4859	264,000	200,000
4864	275,000	200,000

Precision Manufacturing Eliminates Staggered Pins

Side bowing (when the chain hangs crooked) has been a problem in bucket elevator chains for years. The condition occurs when the pitch of the outer sidebars is not held to tight tolerances or when pin links are not built straight. Staggering pins or pin links had been believed to correct the problem.

We have a better idea. We manufacture 4000 Series Chains to exacting tolerances using state-of-the-art production equipment and methods. This enables us to produce high performance cement plant elevator chains **without** staggered pins. Tsubaki 4000 Series Chains hang straight and true without compromising strength or wear life.

Maximum Wear Life

Extra deep induction hardening of pins and carburizing of bushings provide unsurpassed wear life. After years of testing, we developed a high hardness specification so our 4000 Series Chains resist abrasion by cement. This ensures maximum wear life and the toughness necessary to survive extended periods of service in cement plant bucket elevators.

Barrier Seal Design for Longer Wear Life

The 4000 Series Chain bushings extend beyond the inside sidebar to establish a barrier. This virtually eliminates abrasive material from entering the pin/bushing joint area. This heavy-duty hardened part will not wear out prematurely, and it will not separate from the chain and contaminate current plant production batches. Located between the inside and outside sidebars, the barrier seals prevent a build-up of material due to "flooding" of the elevator boot section, which can result in dry cavitation of pins.

[1]Hole can also be supplied for 1/2" size bolt.

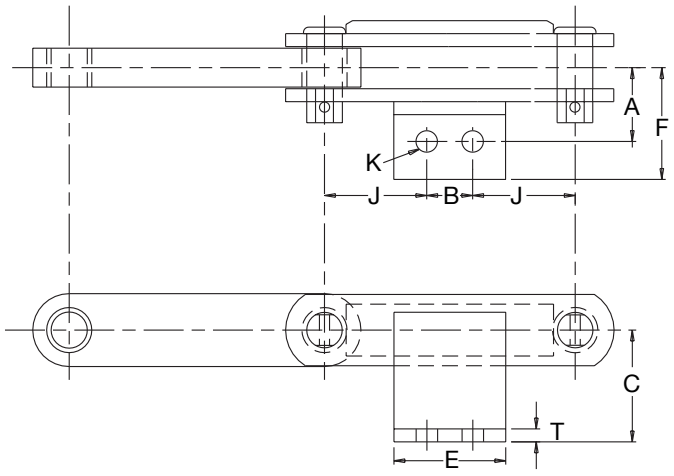
To locate compatible sprockets for your chain, refer to the Product Cross-Reference at the back of this section.

Note: Dimensions are subject to change. Contact Tsubaki Technical Support to obtain certified prints for design and construction.

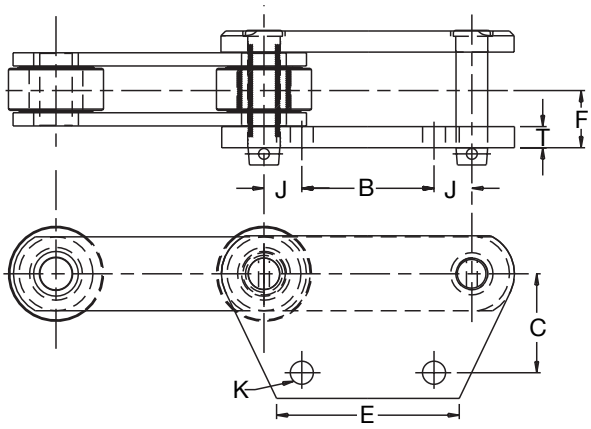
Stack Reclaimers

Stack Reclaimers are popular when heavy industrial processes require that large storage piles of lump material are necessary. Reclaimer chain and flight assemblies function like scraper conveyors, less the trough, with flight blades that push material toward a belt feeding conveyor. The reclaimer conveyor's chain with digging flights are supported by rails and structure which span over or across the pile being reclaimed for transfer to plant processes.

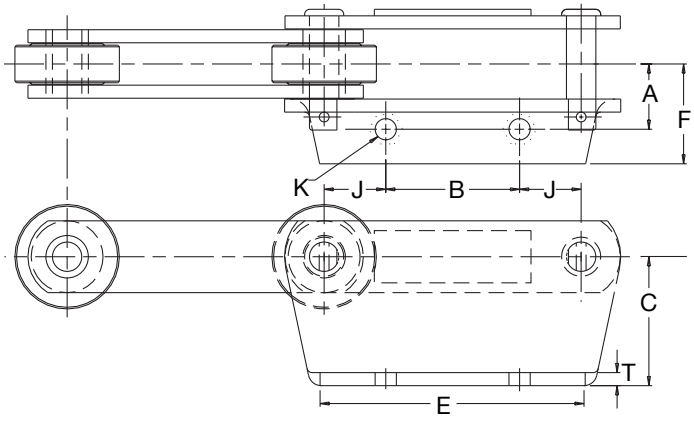
22568



22535



22220



Reclaimer Chains

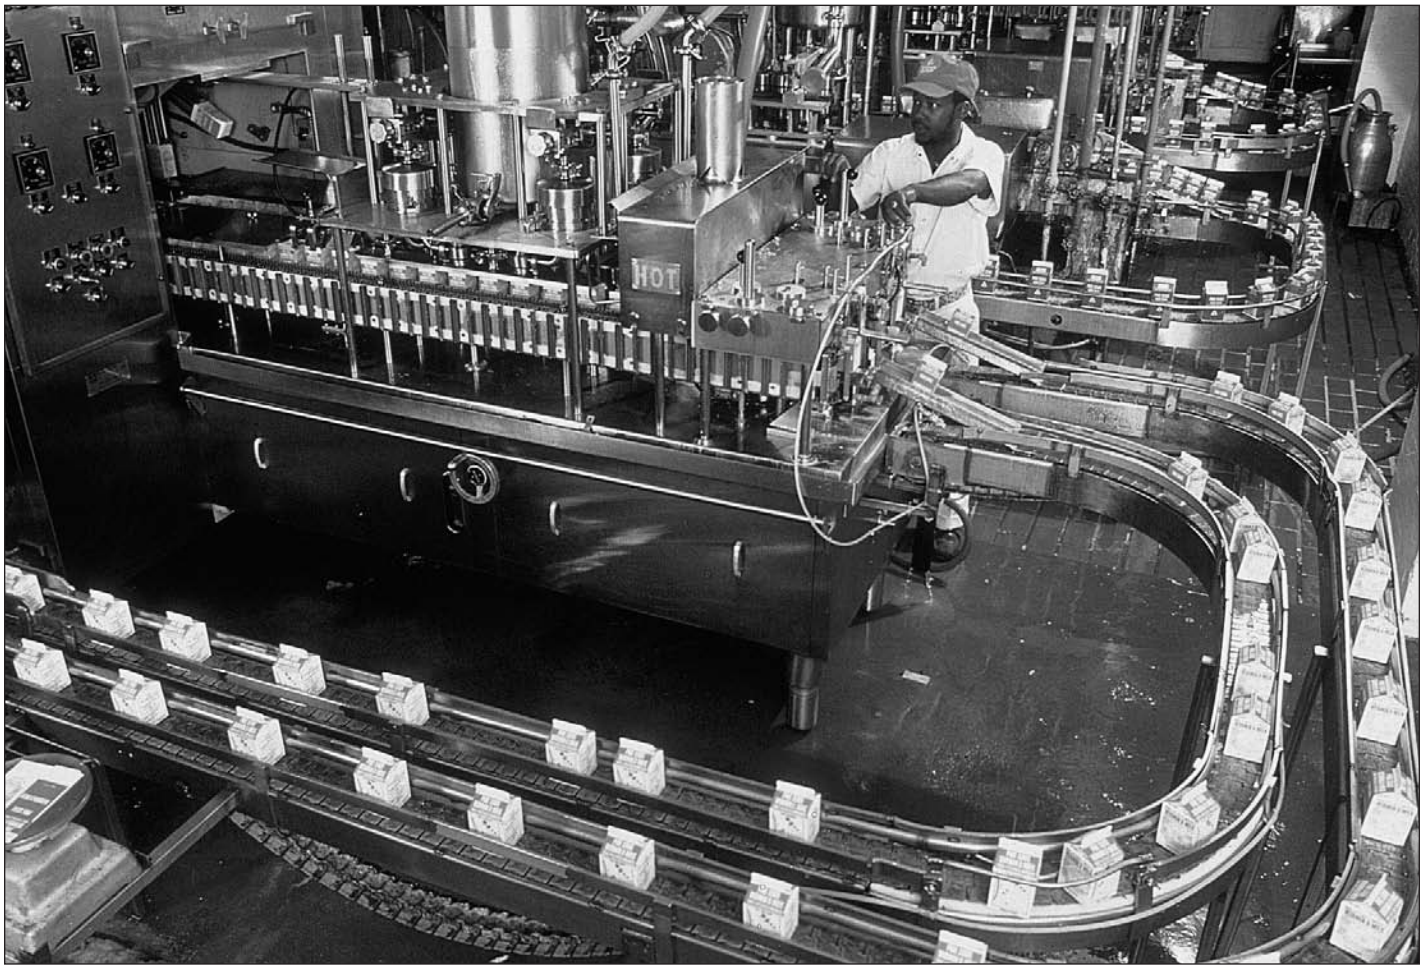
Note: Dimensions are subject to change. Contact Tsubaki Technical Support to obtain certified prints for design and construction.

Dairy Handling

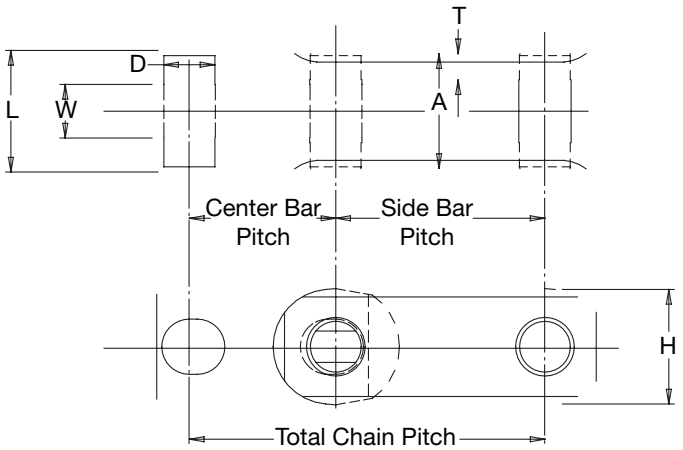
In-floor conveyor systems move the dairy industry. Tsubaki makes outstanding conveyor chains for this application. These conveyors are usually designed with two endless chains running parallel on 7" to 8" centerlines. Typical chain manufactured lengths are 40 to 50 feet; conveyor track lengths are usually about 100 feet.



Dairy Handling

In-floor conveyors at dairy plants generally move case weights of up to 15,000 pounds; however, Tsubaki Dairy Handling Chains have an ultimate strength rating of up to 48,000 pounds per strand. The added strength means longer-lasting chain for your application—chain that can stand up to variable or shock loads and keep performing. We have a variety of Dairy Handling Chains in stock; we've listed a few standard chains in the following chart. We can also manufacture a chain to your exact specifications. With Tsubaki, you get the flexibility to make your business succeed.

DF-3498



DF-3500 and DF-3910

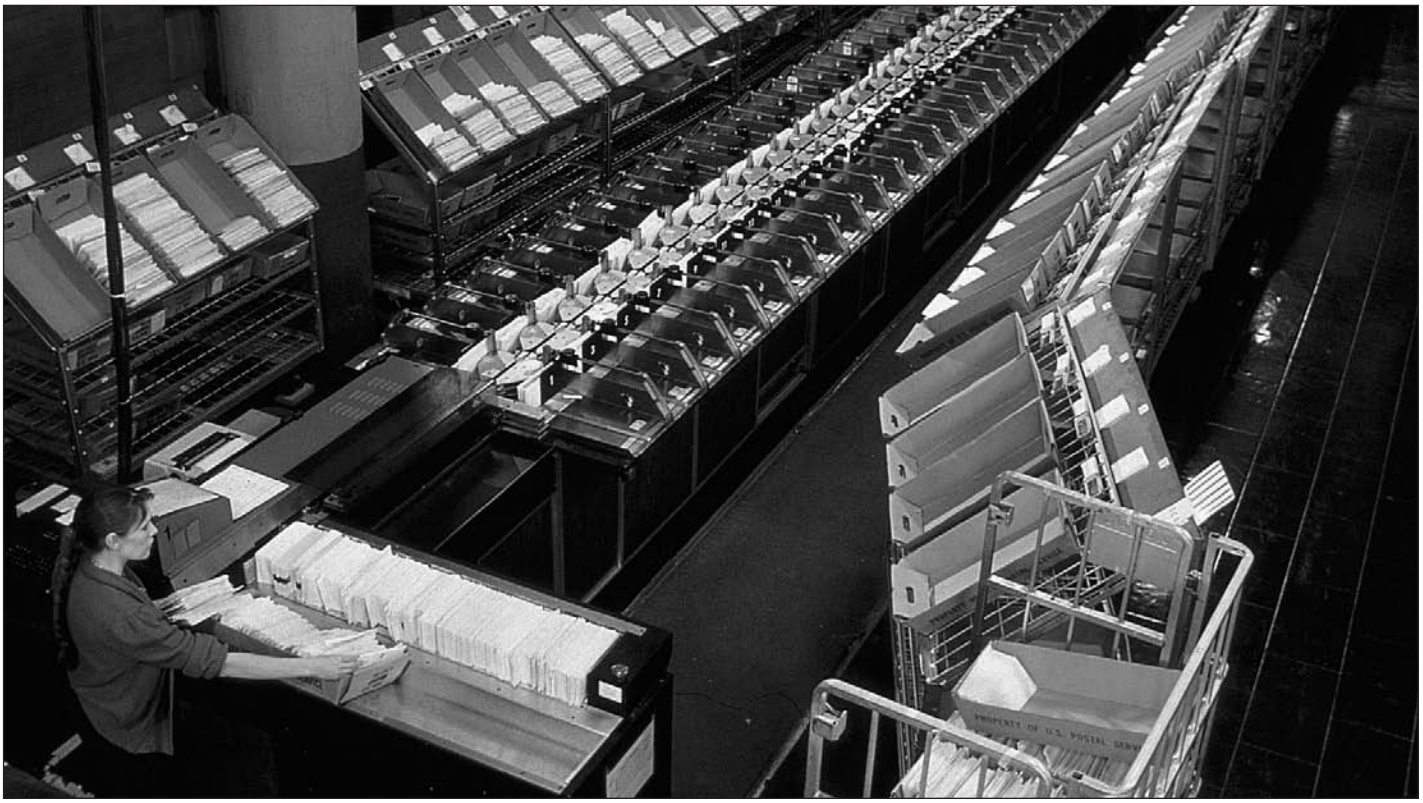
Note: For additional chain application information, refer to the section on Double Flex Bar and Pin Chains beginning on page C-71. To locate compatible sprockets for your chain, refer to the Product Cross-Reference in the back of this section.

Note: Dimensions are subject to change. Contact Tsubaki to obtain certified prints for design and construction.

Distribution/Material Handling

Tsubaki is a leading supplier of Sortation and Bi-planer Chains in the distribution and material handling industries for some very good reasons.



Tsubaki welds hold better.

Most manufacturers use hand welds, which frequently introduce defects into the chain system. We developed an automatic method to weld the bosses to the sidebars. Welds are consistently sound and the proper size.

Sidebars are treated for extra strength and long wear.

We heat-treat sidebars with atmosphere-controlled furnaces to match the carbon levels. Temperatures are controlled by microprocessors to maintain proper austenitizing and tempering conditions. The result is stronger chains for your sortation machinery.

Quality checks ensure accuracy.

We test every temper load to make sure parts meet your specifications. That means you get reliable chain for your operation.

Select the right chain for your application.

Sortation and Bi-planer Chains are usually supplied in either 9" or 12" pitch. Attachments are welded boss or E-Style. They can be furnished with Urethane, Hytrel, or UHMW rollers.

Food Processing

Food processing is a large industry with several subcategories, and each has special needs and requirements. Tsubaki manufactures chain for a wide variety of applications in the food industry. Some carry heavy loads, some are subjected to high temperatures, and others endure frequent washdowns. Each requires reliable chain to move product quickly and efficiently. However, the types of chain vary, depending on the application.

Engineering Class Chains and Sprockets from Tsubaki are used extensively in six areas:

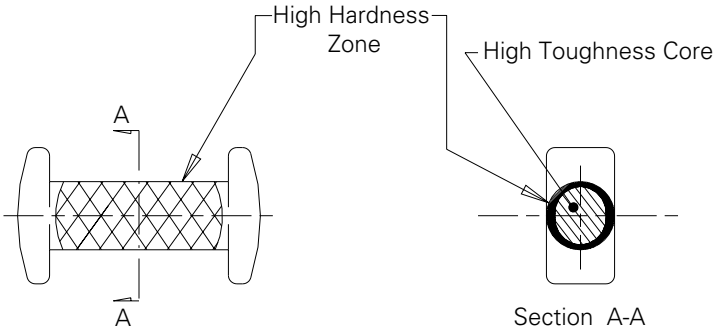
- Red meat processing
- Poultry processing
- Commercial baking ovens
- Dehydrator ovens
- Citrus processing
- Cooker ovens

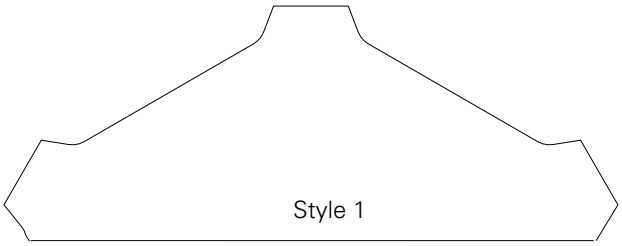
Food Processing

Red Meat Processing

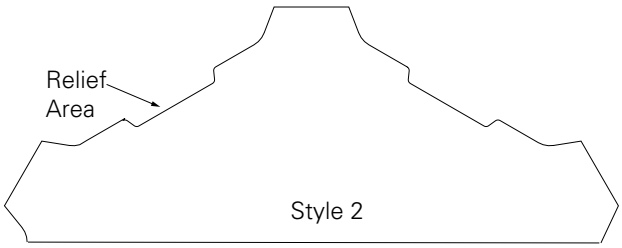
Delrin (Acetal) Bushed Conveyor Chain is used primarily in meat processing and packing plants. Even in these wet, corrosive environments, the Delrin (Acetal) insert eliminates the need for lubrication. These chains feature K-2 attachments; Acetal insert rollers; stainless steel bushings; and electro-galvanized sidebars, pins, and rollers, see page C-94. You get lube-free operation for a clean environment. Trolley conveyors and long, complex, overhead conveyor systems such as on the primary processing line in a slaughterhouse require Drop Forged Rivetless Chain, see page C-65. The open joint construction allows for easy washdowns and helps prevent contamination. For extended wear, select Ultra Wear Life-Drop Forged Rivetless Chain, an innovative product that extends wear life of rivetless chain 40 percent or more. This extraordinary performance is achieved with special steels and a proprietary pin hardening process. The result is a pin with a very hard, wear-resistant surface over a ductile core. UWL-Drop Forged Rivetless Chain is available in both X-Style and Barloop Style. Pay particular attention to the style of sprocket you select and use with Drop Forged Rivetless Chain. Some attachments on overhead slaughterhouse lines, including slider attachments, require additional clearance that is not accounted for in standard sprockets. The Tsubaki Technical Support Division offers sprockets that are specially designed with relief areas to accommodate attachment protrusion, helping the Drop Forged Rivetless Chain to stay in the sprocket and preventing premature chain joint wear.

Higher Hardness Pin for "Ultra Wear Life" Performance





Standard sprockets are not designed for some applications like overhead slaughterhouse lines where the attachment requires extra clearance.



Drop Forged Rivetless Sprockets from the Tsubaki Technical Support Division have a "relief area" that allows for attachment protrusion. This means better articulation and longer wear life.

[1]DS-1113 and DS-6272 furnished with counter sunk attachment holes.

[2]Material: CCH = Carbon case hardened; CHT = Carbon heat-treated; HC = High carbon; SSHT = Stainless steel heat-treated; AHT= Alloy heat-treated; PMHT= Powdered metal heat-treated.

Notes: DS Series Chains have zinc-plated sidebars, pins, and rollers. The bushings are heat-treated stainless steel.

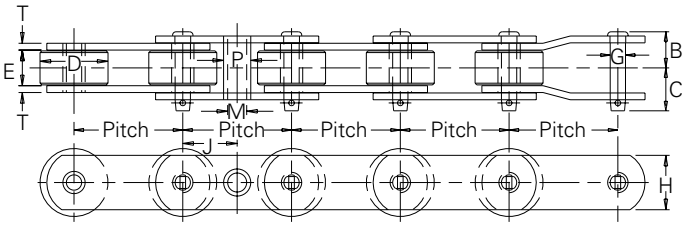
To locate compatible sprockets for your chain, refer to the Product Cross-Reference at the back of this section.

Note: Dimensions are subject to change. Contact Tsubaki Technical Support to obtain certified prints for design and construction.

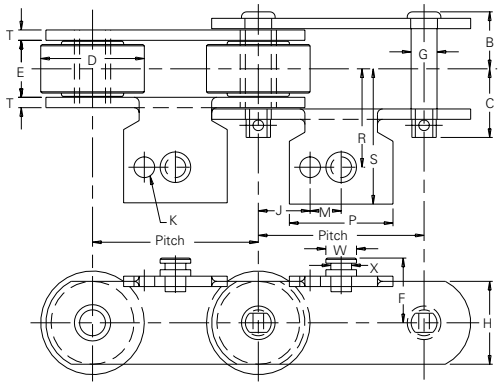
Commercial Baking Ovens

Engineering Class Chains are excellent in this application because they stand up to high temperatures and can be used in horizontal and vertical configurations. We offer a variety of constructions for baking and proofer ovens. Contact Tsubaki for more information.

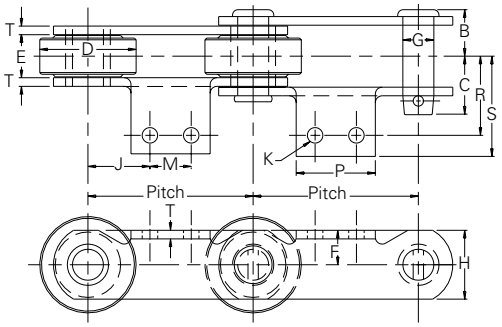
40004



40005



60003



Baking Ovens

Note: Extended pins either every 14th or 18th pitch.

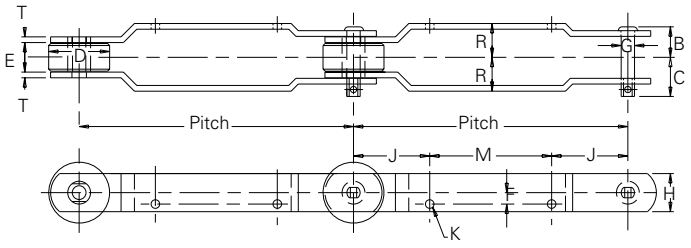
To locate compatible sprockets for your chain, refer to the Product Cross-Reference at the back of this section.

Note: Dimensions are subject to change. Contact Tsubaki Technical Support to obtain certified prints for design and construction.

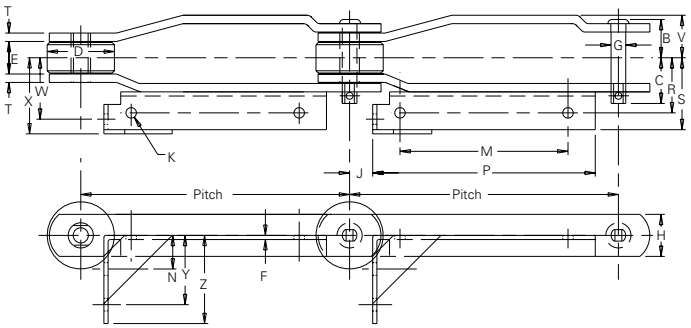
Dehydrator Ovens

Dehydrator ovens remove moisture from foods at a temperature around 200˚F. This mildly corrosive environment can be hard on some chains. That's why we provide heat-treated carbon steels or stainless steels.

90001



80002 and 80003



90002

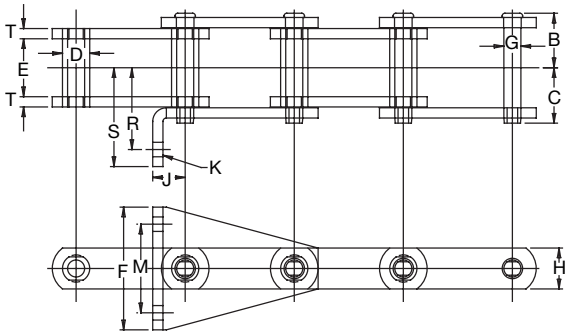
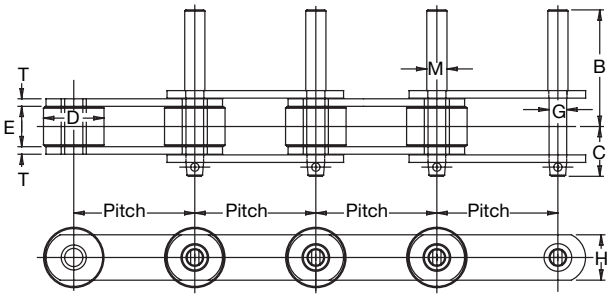
Citrus Processing

This can be a harsh environment for chain—continual operation, minimal lubrication, and corrosion. We have a line of citrus processing chains that have been engineered to meet these specialized demands. The conveyor and elevator chains with G-19 attachments that we show are commonly used to convey or elevate citrus products. The conveyor chain with D-5 attachments is used in washing, sorting, and inspection lines. These are just a few of the chains that the Tsubaki Technical Support Division can make to meet your specifications.

188 and 102B with G-19 Attachment



303R and 53R with D-5 Attachment



89R with G-19 Attachment

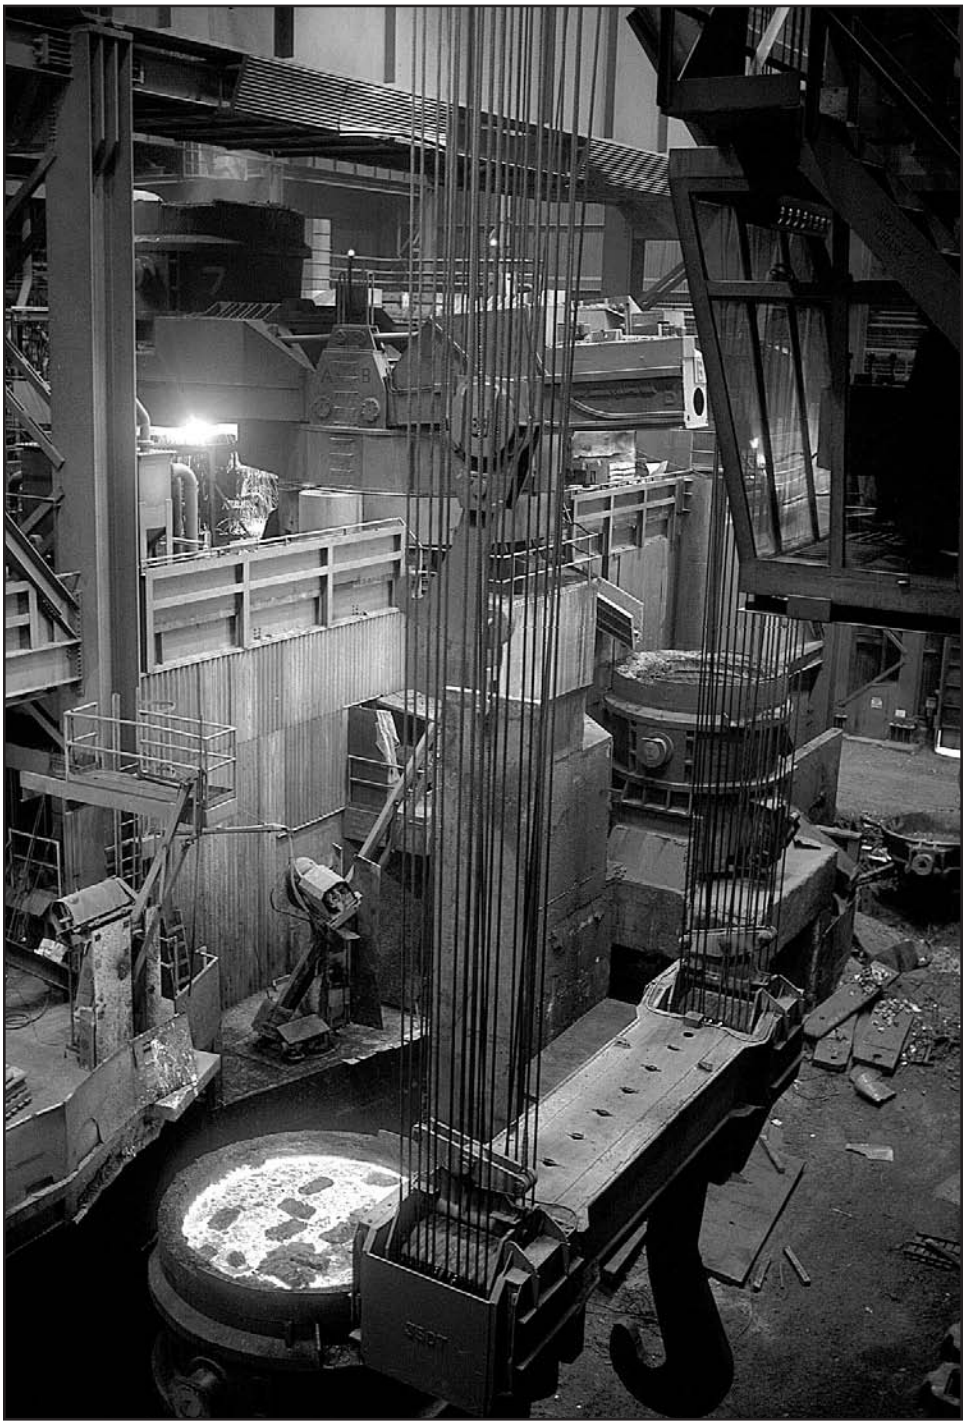
[1]Furnished standard with G-19 attachment every 4th pitch.

To locate compatible sprockets for your chain, refer to the Product Cross-Reference at the back of this section.

Note: Dimensions are subject to change. Contact Tsubaki Technical Support to obtain certified prints for design and construction.

Metal Processing

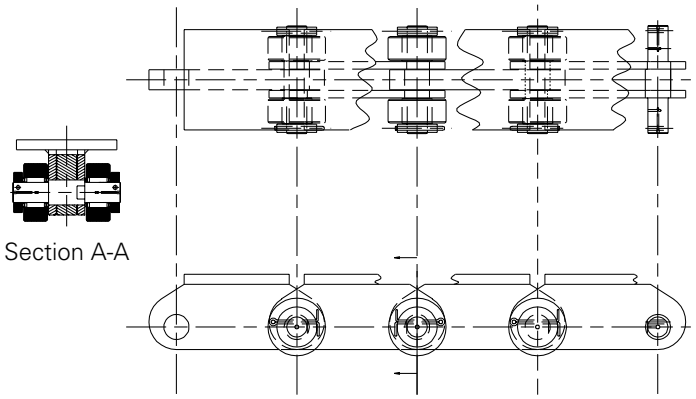
The metal processing industry has special conveyor needs. The weight of the materials, distance to be conveyed, and the environment make great demands on chain. Tsubaki Conveyor Chains are designed to stand up to the punishing conditions as raw metals are turned into finished goods. We offer a variety of Conveyor Chains for the metal processing industry. Some are listed on the following pages. In addition, we can manufacture a chain to meet your exact specifications. Contact Tsubaki Technical Support to discuss your application.



Flat Top Chains

Flat Top Chains are designed to convey ingots, billets, large structural shapes, upended coils, and more to and from process operations. The flat top plate design offers large areas to evenly distribute product load. This minimizes the effect of transfer impacts that can cause product damage. In addition, the top plate protects the chain joint from unwanted exposure to heat or abrasive particles. Because of the heavy load, bearing rollers are widely used to provide the lowest chain tension and trouble-free operation.

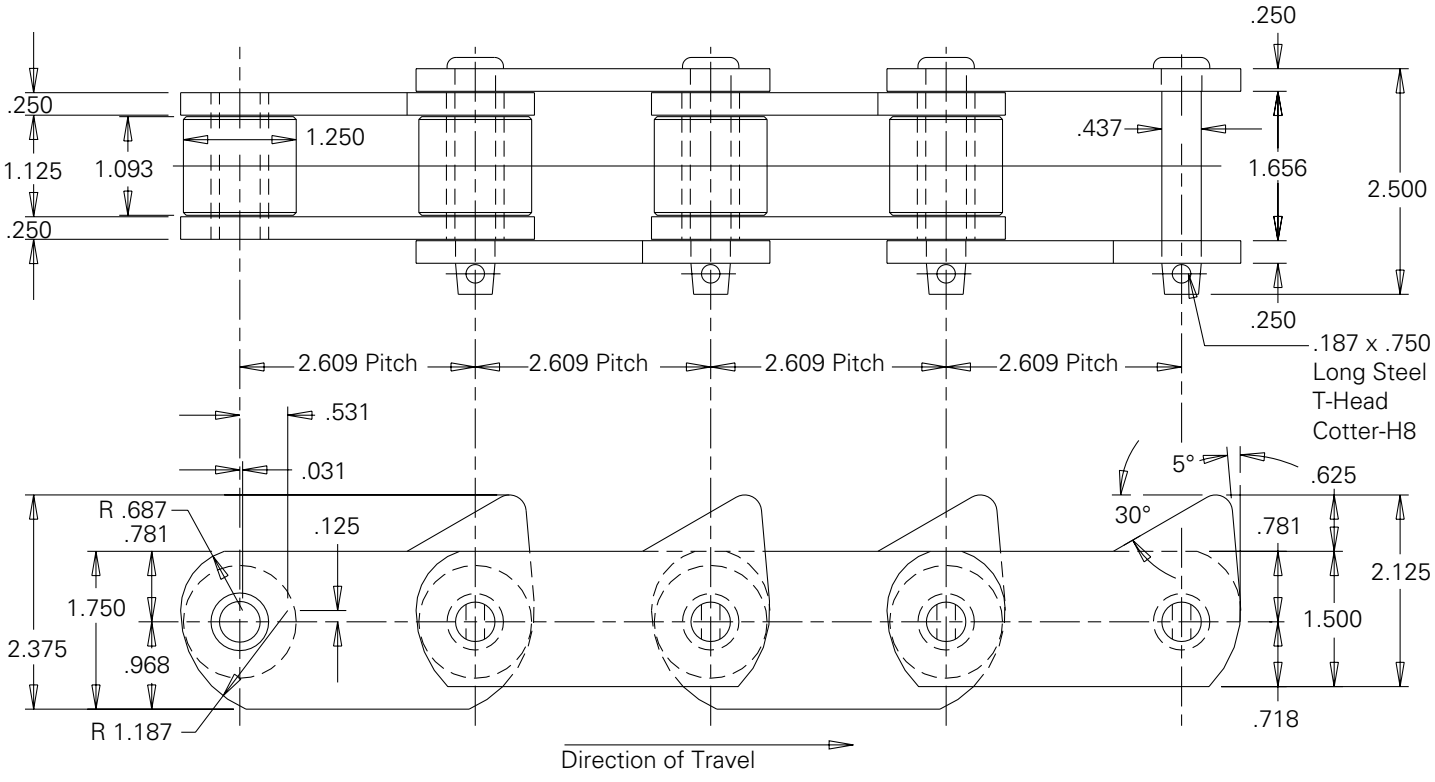
Flat Top Chain



Coiled Wire Chains

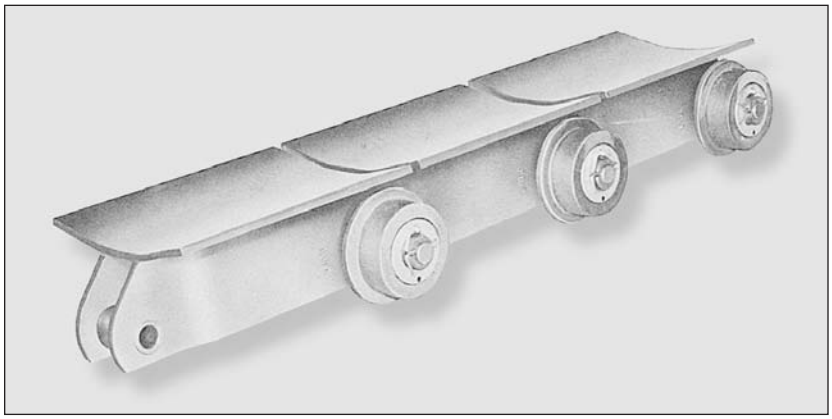
Coiled Wire Chains are designed to run conveyors in hot wire mills. These conveyors act as cooling lines, transferring continuous loops of hot wire, which are coiled after cooling down. Coiled Wire Chains are offered with special M-style attachments at every pitch to force the wire to fall between as it is loaded onto the moving conveyor.

Coiled Wire Chain with M Attachment

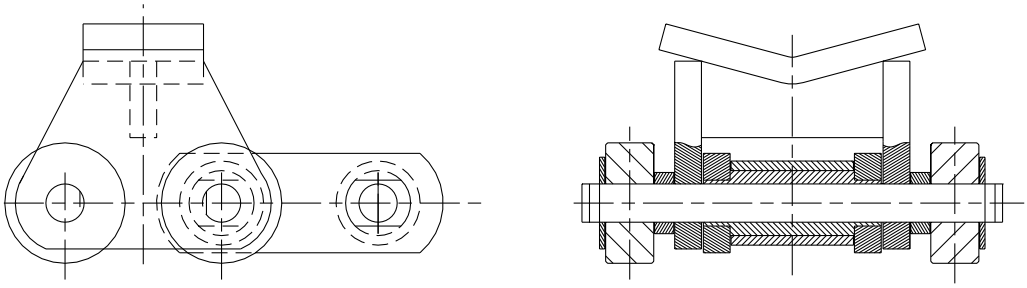


Coil Conveyor Chains

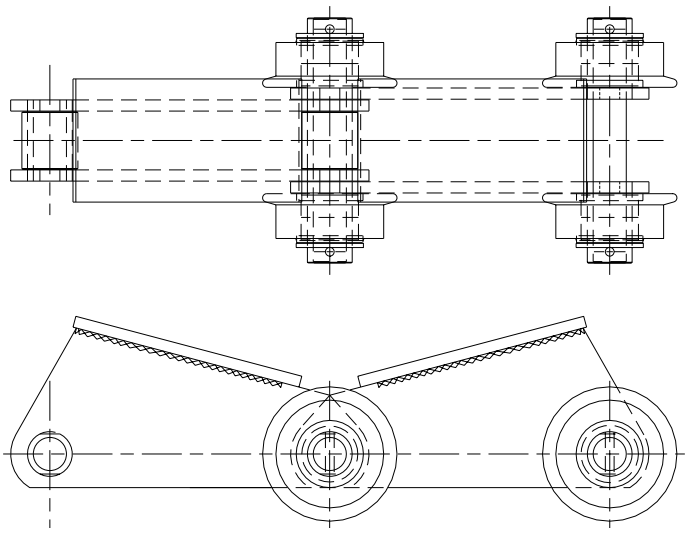
Move coils, pipe, tubing, or other large, round shapes with Gull Wing Chains or Saddle Attachments on Roller Conveyor Chains. The “V” shape is designed to accommodate a range of diameter sizes that run within the process. The saddle or “V” plate corner edges can be ground smooth to avoid scratching product during transfers. Gull Wing Chains or Saddle Attachments on Roller Conveyor Chains can be adapted to a variety of conveyor configurations, from top plates to bearing rollers and from inboard to outboard carrier rollers. Often economy is achieved through the use of multiple chain strands or chain strands independent of carrier assemblies.



Gull Wing Chain



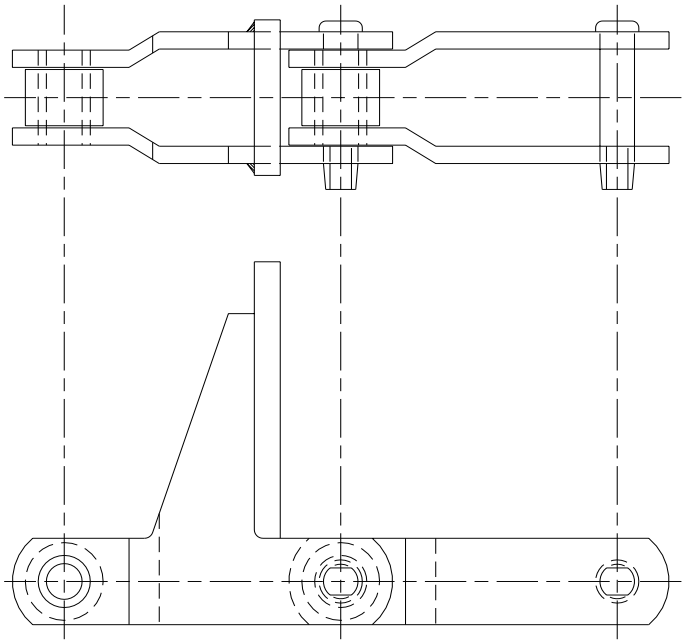
Saddle Attachment



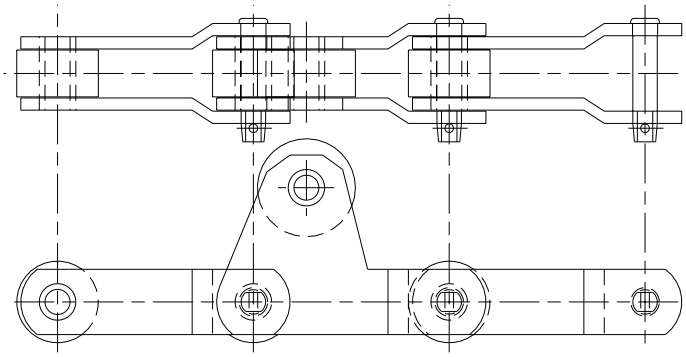
Pusher Attachment Chains

Pusher Attachment Chains are designed for cooling beds where temperatures can reach 1,900°F. Special finger attachments push against sliding or rolling product such as billet or bars, keeping it on-line. Pusher Attachment Chains are usually designed with three to six strands across to side push evenly through the bar length. Attachments are generally MM-style with top rollers or pusher bars that project upward to engage product for side transfer movement. Designs are customized to your operation, based on the width or shape of the conveyed material.

MM Attachment



Top Roller Attachment



Mining

Tsubaki is a leading manufacturer of mining chains that are used in underground, above ground, and preparation plant applications. We use alloy-grade steels, heat-treated to precise specifications and assembled with the heavy press-fits required to withstand the punishment of today's more powerful, high production mining equipment. Our complete line of mining chains includes: Shuttle Car Chain, Feeder Breaker Chain, Tram Drive Chain, Wash Box Chain, Drop Forged Rivetless Chain, and Jig Washer Chain. To better service your industry, nearly all of the mining chains are in-stock and ready for immediate shipment. We also manufacture made-to-order chains and attachment configurations for your individual requirements.

Note: Dimensions are subject to change. Contact Tsubaki Technical Support to obtain certified prints for design and construction.

Sugar Manufacturing

Sugar mills require strong, reliable chains to move cane through the manufacturing processes. We manufacture many types of chains used in the sugar industry, including Conveyor, Bagasse Carrier, Drop Forged Rivetless, Welded Steel, Cast Combination, and Main Cane Apron Conveyors. Our chains are specially designed to meet the high tonnage and extensive operating conditions of modern mills.

We build quality into every Tsubaki Sugar Chain.

Proper Fit

Tsubaki Sugar Chains are designed to fit your equipment properly, with precision where you need precision and ruggedness where you need ruggedness.

Strong, Long-Lasting Materials

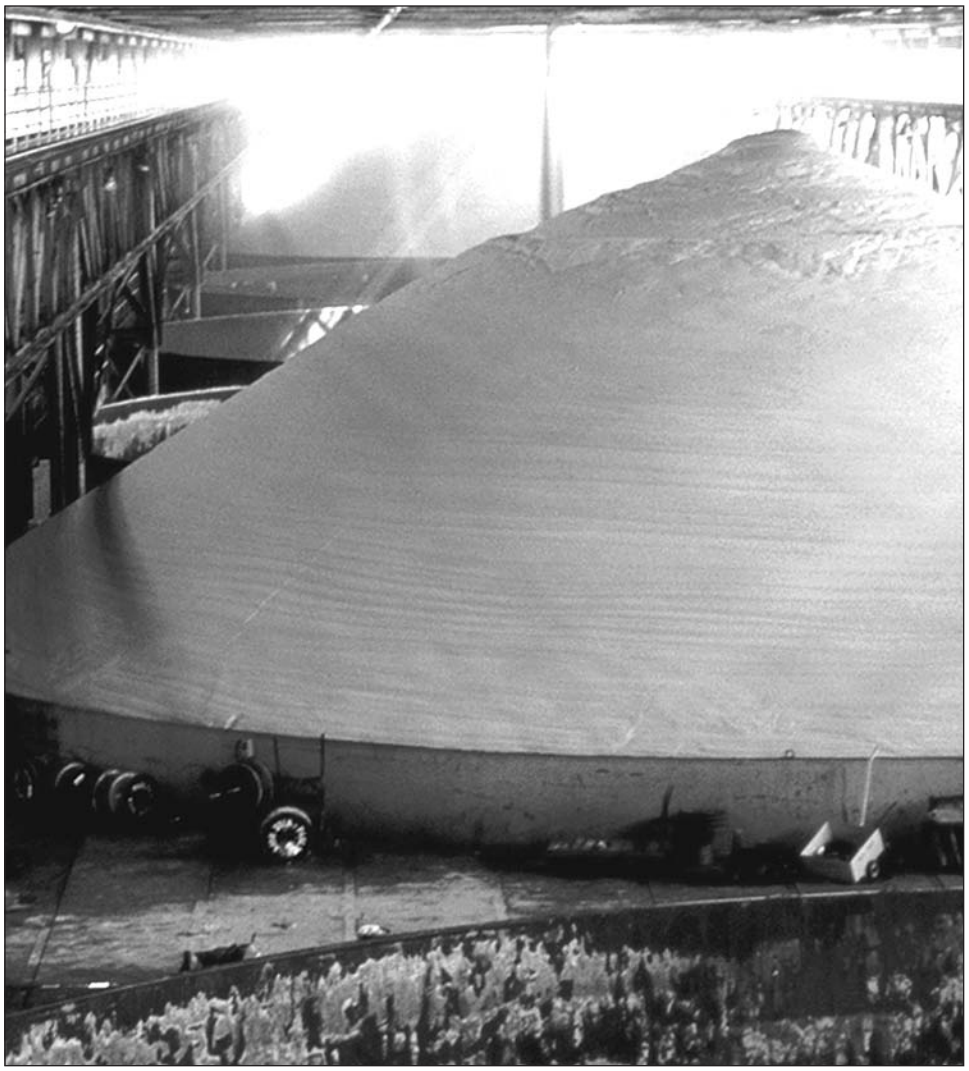
We create the right balance of high carbon and alloy steel in every component to ensure proper hardness and strength. You get chain that can stand up to the hard use of sugar mills.

Heat-Treated for Extended Wear Life

All chain components are heat-treated to our rigid specifications for longer wear life. You get long-lasting, cost-effective chain for your sugar mill.

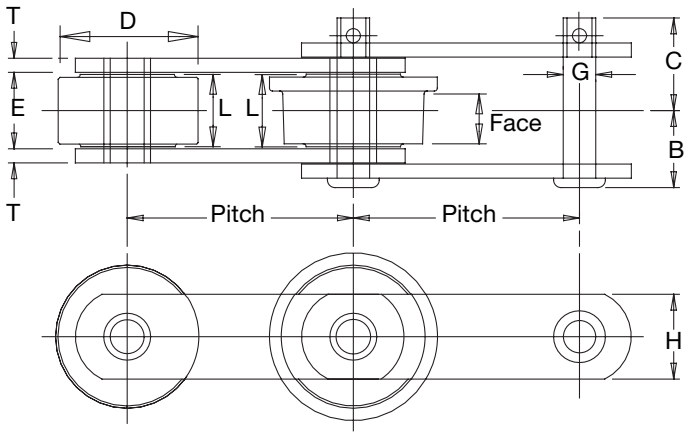
Constructed to Resist Breakage

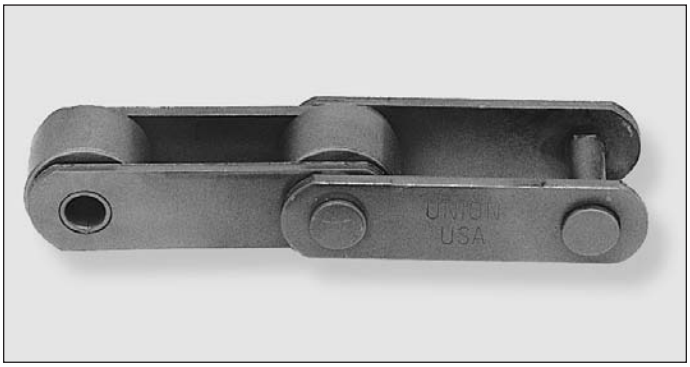
Links are subassembled on rigid presses with accurate fixturing. The result is a very high press fit of pins and bushings in sidebars, which produces the highest resistance to breakage under shock loads and keeps the chain straight and square to rigidly support chain flights.



Roller Conveyor Chains

Tsubaki Roller Conveyor Chains are constructed to last in your operation. These chains are typically used for conveying or elevating applications. Sidebars are fabricated from carbon or alloy steels for long wear life. Pins and bushings are made from carbon or alloy steel and heat-treated and hardened. Dimensions of pins are checked to ensure straight, smooth-wearing surface and a proper fit of the pin in the link bar. Pin and bushing holes are carefully finished to ensure true pitch accuracy and correct interference fit.





Roller Conveyor Plain Chain

All dimensions are in inches unless otherwise indicated.

[1]Bushing styles are typically full round or double flat, but may differ depending on the specific application.

[2]Styles for rollers, pins and sidebars are shown on pages C-17 – C-18.

[3]Material: CHT = Carbon heat-treated; CCH = Carbon case hardened; AHT = Alloy heat-treated; CRS = Cold rolled steel; AIHT = Alloy iron heat-treated; ACH = Alloy case hardened; HC = High carbon; PMCCH = Powdered metal carbon case hardened.

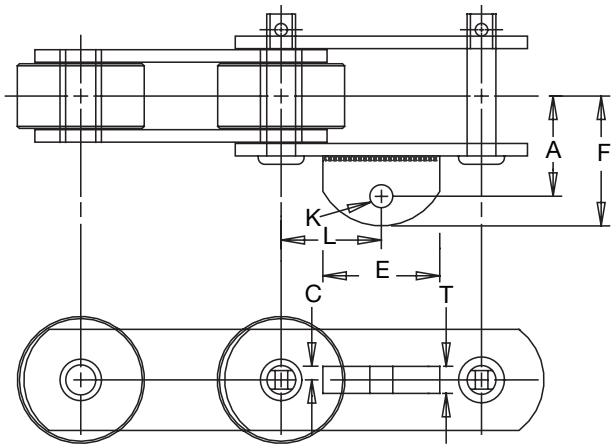
To locate compatible sprockets for your chain, refer to the Product Cross-Reference at the back of this section.

Note: Dimensions are subject to change. Contact Tsubaki Technical Support to obtain certified prints for design and construction.

TSUBAKI

Bagasse Carriers

Bagasse Carriers are the efficient, economical way to handle bagasse that is to be fed to boilers, put into storage, or further processed. The alloy steel pins are heat-treated for wear resistance and can be nickel-plated to prevent corrosion fatigue. The high-strength sidebars are designed to withstand heavy shock loads. We even made the base of the 2-C flight wings thicker to last longer.



Bagasse Carriers

All dimensions are in inches unless otherwise indicated.

Attachment Number	Chain Number					Bolt Diameter			Approximate Weight (lbs/ft.)

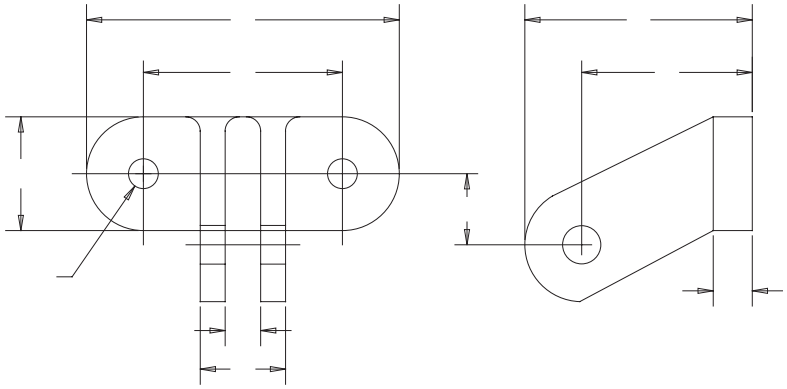
Hinged Bucket and Scraper Flight Wings for Bagasse Carriers

Flight wings are used with double strands of parallel chain and are usually connected to the A-42 chain attachments. This helps prevent the chain from binding by compensating for irregularities in the length of the two strands.



Hinged Bucket and Scraper Flight Wings

All dimensions are in inches unless otherwise indicated.

To locate compatible sprockets for your chain, refer to the Product Cross-Reference at the back of this section.

Note: Dimensions are subject to change. Contact Tsubaki Technical Support to obtain certified prints for design and construction.

Water Treatment

Tsubaki offers a variety of drive and conveyor chains for use in water treatment applications. Many industrial plants and power stations draw water from nearby lakes, rivers, or bays for use in process and cooling applications and to feed boilers. Traveling water and bar screens prevent the intake of fish, rocks, debris, and suspended solids that could damage equipment or foul water circulation systems. Both types of screens use special chains that must be replaced periodically because of corrosion and wear.

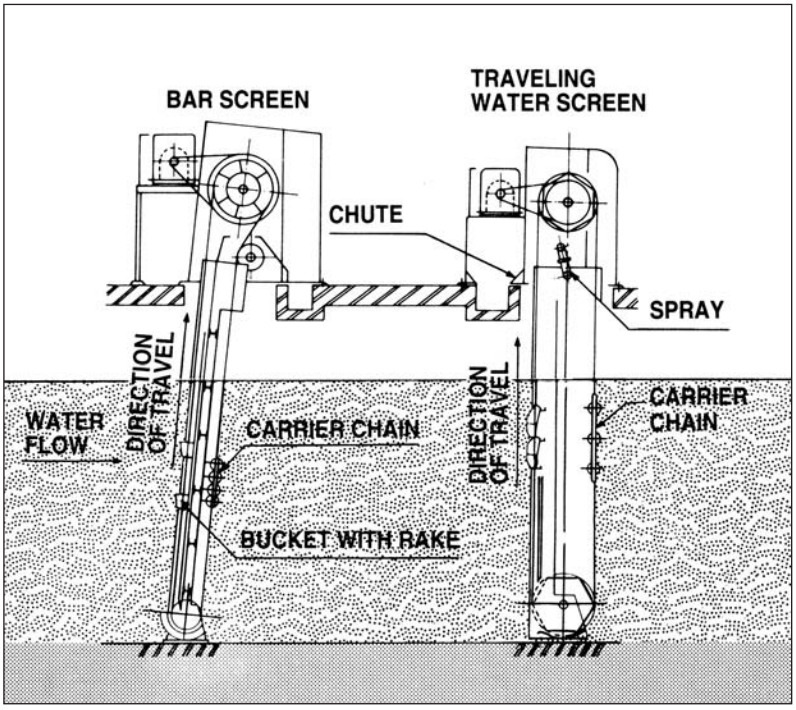
Industries commonly screening inlet waters include:

- Power generating plants (coal, petroleum, nuclear)
- Pulp and paper mills (also removing wastes from in-plant streams)
- Steel mills
- Chemical and processing plants
- Refineries
- Food processors
- Any plant operating a large power boiler to produce steam

Water Treatment

Select Tsubaki Chains

Tsubaki Traveling Water and Bar Screens are specially designed to stand up to this corrosive environment. Pins and bushings are through hardened for extended wear life. Rollers are constructed of cast iron or through hardened stainless steel and have a special synthetic resin bushing for smooth operation. The resin bushings require no lubrication, saving you time and money. To add even more protection, Tsubaki Treatment Chains are double-treated for extra corrosion resistance—first with an adhesive sealant in the pin, bushing and link plate press-fit areas, and then with an anti-corrosion, rust-prevention coating. That means strong, long-lasting chain for your screening environment.



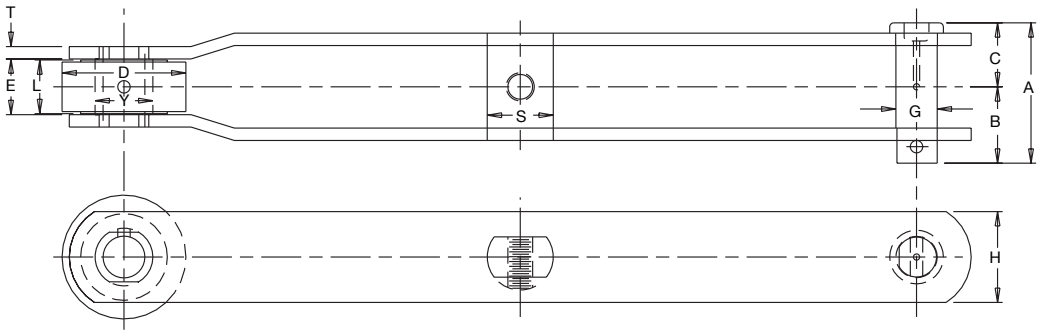
Factors to Consider

Kind of water. Fresh water has a different chemistry than salt or brackish water and has a different impact on chain. Several different types of materials are used, including heat-treatable, stainless steels, alloy steels, and cast iron rollers. Choose the construction that is right for your application. If you have any questions, contact Tsubaki Technical Support.

Types of water screen chain. There are three main types of water screen carrier chain. Tsubaki produces all three with either 3/8"- or 1/2"-thick sidebars. Pitch is usually 24", but each type has distinctive characteristics.

Styles of bar screen chain. 700 series, 6-inch pitch
chains are widely used. Sidebars are usually 5/16" for standard and 3/8" for heavy-duty applications. Other chain series are also available.

Style A



Traveling Water Screen Chains

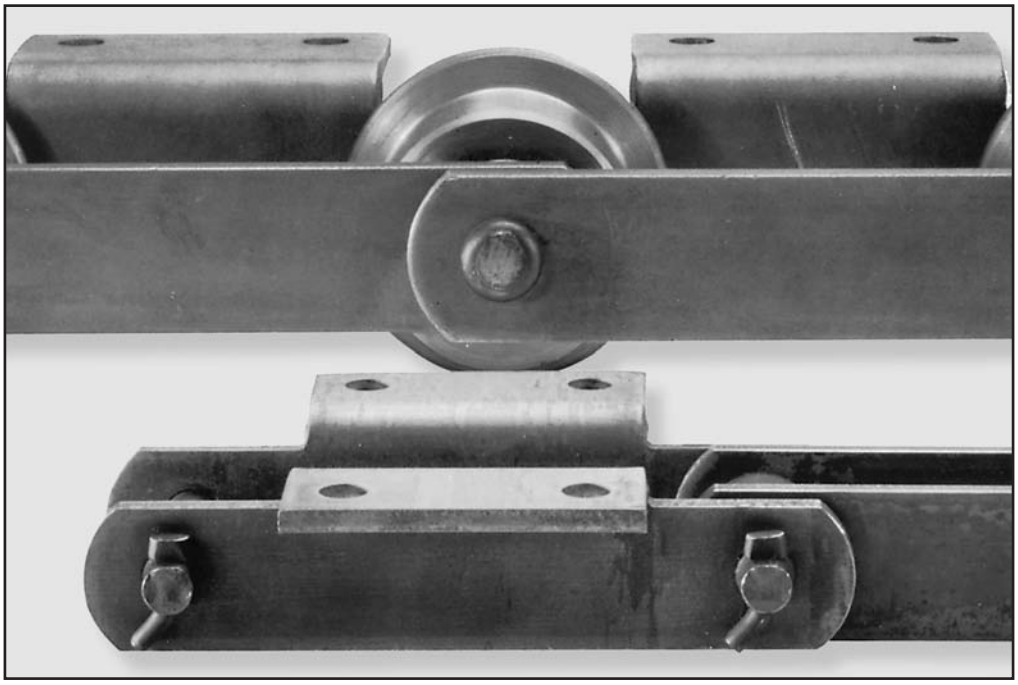
RF Metric Series Chain Introduction



Solve Special Material Handling Problems

Tsubaki is proud to offer Specialty Conveyor Chains for conveying applications that run in extreme conditions. Sanitation systems; flow conveyors; grain, cement, or adhesive powder conveyors; and auto assembly plants are just a few of the operations that require special chains. Our Specialty Conveyor Chains are designed and manufactured to meet the needs of a variety of continuous and intermittent material handling applications when belt, screw, or pneumatic conveyors are not appropriate. Specialty Conveyor Chains provide high strength, accurate handling, and minimal wear elongation. In fact, they are superior to any other kind of conveyor equipment.

Conveyor Chains for Special Applications

Smooth and stable flow of material depends on the performance of your conveyor chain. Even a simple conveying system will not run smoothly and provide stable on-line loads without the proper chain. To move raw materials or heavy bulk items or to operate in extreme conditions, rely on Specialty Conveyor Chains to get the job done.

Built to Work in Your Applications

Specialty Conveyor Chains are built to last in the most chal-lenging conditions. In fact, we build the quality into every step.

- Materials are selected to stand up to extreme temperatures and shock loads.
- Each chain is manufactured to tight tolerances to ensure the highest standards.
- Components are finely finished and accurately assembled to provide high wear resistance and top performance for long periods.

When the going is tough—choose Specialty Conveyor Chains from Tsubaki.

RF Metric Series Chain Introduction

Types of Specialty Conveyor Chains

DT (Basic) Series
The pins and bushings are heat-treated and hardened for high wear resistance. The link plates are made of carbon steel and can be welded to attachments easily. The chains in this series are suitable for handling a wide variety of materials. DT (Basic) Series chain offers versatility and economy for your operation.

AT Series
All parts, mainly produced from special alloy steels, are heat-treated for higher tensile strength and better wear resistance. Average tensile strength of AT Series chain is about twice as high as the DT (Basic) Series. Link plates are all heat-treated and hardened.

AT Series chain is suggested for compact conveyor designs and when high wear resistance of link plates and long chain service are required.

PT Series
All parts are made of ANSI 400 Series stainless steel and are heat-treated and hardened. PT Series chain is suggested for corrosive or abrasive applications.

ST Series
All parts are made of 18-8 stainless steel (ANSI 300 Series). This chain is suggested for strong acid/alkali applications and very hot or sub-zero environments.

CT Series
CT Series chain is ideal for handling hard abrasive materials such as cement.

BT Series
BT Series chain has higher tensile strength than CT Series. The wear resistance of BT Series chains is much greater than that of the AT Series.

Other
We offer a wide variety of made-to-order combinations of steel materials and heat-treatments to create the chain you need for your application. contact Tsubaki Technical Support for details.

Chain Series	Component Parts[1]					
	Link Plate	Pin	Bushing	"R" Roller	"F" Roller	"S" Roller
DT (Basic)	Car	Aly-TH	Car-CH Aly-TH	Car CI	Car CI	Car-CH Aly-TH
AT	Aly-TH	Aly-TH	Aly-CH Aly-TH	Aly-TH Car-IH	Aly-TH Car-IH	Aly-TH
PT	S4-TH	S4-TH	S4-TH	S4-TH	S4-TH	S4-TH
ST	S3	S3	S3	S3	S3	S3
CT	Car	Aly-CH Aly-TH-IH	Car-CH Aly-TH	Aly-TH Car-IH	Aly-TH Car-IH	Car-CH Aly-TH
BT	Aly-TH	Aly-CH Aly-TH-IH	Aly-CH Aly-TH	Aly-TH Car-IH	Aly-TH Car-IH	Aly-TH

[1]Materials: Car = Carbon steel; Aly = Alloy steel; CI = Cast iron; S3 = 300 Series stainless steel; S4 = 400 Series stainless steel.
Heat-Treatments: TH = Through-hardened; CH = Case-hardened; IH = Induction-hardened.

RF Metric Series Chain Introduction

Conveyor Specifications & Characteristics

O = available
X = Contact Tsubaki Technical Support
- = not available

Series	Characteristics	Temperature Range	Type of Conveyor						
			Slat	Direct Mounting	Pusher	Scraper	Apron	Flow: S, M, N type Roller	Bucket Elevator: S, M, N type roller
DT	Heat treated pin and bushing.	-20°C to 200°C	O	O	O	O	O	O	O
GT	Higher allowable load than DT	-20°C to 200°C	O	O	O	O	O	-	-
AT	Double tensile strength compared to DT. Higher allowable load than DT.	-60°C to 400°C	O	O	O	O	O	O	O
CT	Special heat-treated pin and bushing.	-20°C to 200°C	O	O	O	O	O	O	O
BT	Twice the tensile strength of CT.	-20°C to 200°C	O	O	O	O	O	O	O
FA	Special hardening treatment on bushing and roller.	-20°C to 200°C	-	-	-	-	-	O	-
BR-DT BR-AT	Cylindrical roller between bushing and roller. Low coefficient of friction. Higher roller allowable load.	-20°C to 80°C	O	O	O	-	O	-	-
RFN	Needle installed between pin and bushing. Zero stretch.	-20°C to 60°C	O	O	O	-	O	-	-
RFC-Lambda	Plastic type roller. Self-lubricating.	-20°C to 80°C	O	O	O	X	O	-	-
NT	All parts are 400 series stainless steel.	-70°C to 400°C	O	O	O	O	O	O	O
PT	1.6 times greater tensile strength than NT. All parts are 400 series stainless steel.	-70°C to 400°C	O	O	O	O	O	O	O
ST	All parts are 300 series stainless steel.	-100°C to 400°C	O	O	O	O	O	O	O
DP	5 times greater corrosion resistance than zinc coating. 20 times greater corrosion resistance than nickel plated. Any material can be DP coated.	-20°C to 200°C	O	O	O	O	O	X	X
MT	Pin and bushing are made of 400 series stainless steel.	-20°C to 200°C	O	O	O	O	O	O	O
RT	Pin, bushing and roller are made of 400 series stainless steel.	-20°C to 200°C	O	O	O	O	O	O	O
YT	2 times greater tensile strength than RT. Pin, bushing and roller are made of 400 series stainless steel.	-20°C to 400°C	O	O	O	O	O	O	O
ERB-DT EBR-AT	Special cylindrical roller installed between bushing and roller. Lube free, low coefficient of friction.	-20°C to 50°C	O	O	O	-	O	-	-
WEBR	Special cylindrical roller installed between bushing and roller. Lube free, low coefficient of friction.	0°C to 50°C	O	O	O	-	O	-	-
KEBR	Special cylindrical roller installed between bushing and roller. Lube free, low coefficient of friction.	300°C	O	O	O	-	O	-	-

Notes: Please Contact Tsubaki Technical Support when temperatures are greater than 752°F.
The 400 material used for the "S" roller on RF03075 and RF03100 is 600 series stainless steel, not 400 series stainless steel.

RF Metric Series Chain Introduction

As a leading manufacturer of chains and conveyor equipment, with over 85 years of experience, Tsubaki has undertaken extensive research and development in both the design and manufacture of conveyor chains. Many of Tsubaki's conveyor chains have been standardized to meet various applications for different operating conditions and circumstances. Any standardized chain can now be supplied within a short delivery time. Apply the most suitable chain to meet your application by selecting from the wide range of standardized Tsubaki Conveyor Chains.

Specifications			Features • Applications	Temperature	Series
Normal Conditions	Standard Series		Can be used for a wide variety of applications.	-20˚C to 200˚C	DT
	Plastic Sleeve Series		The chain is self-lubricating, light weight, low noise and has a low coefficient of friction. This chain has a very long life, while requiring no lubrication.	-20˚C to 80˚C	RFS
	Wear resistant between bushing and roller		The composition of R and F rollers is altered, increasing the wear life between the bushing and roller allowing a higher allowable roller load.	-20˚C to 200˚C	GT
	Reinforced Series		Approximately two times tensile strength of the standard series with much higher roller load capacity.	-60˚C to 450˚C	*AT
	Wear resistant pin and bushing	Standard	Wear resistance between pin and bushing is improved using a special heat-treating process.	-20˚C to 200˚C	CT
		Standard	Increased wear resistance between in and bushing.	-20˚C to 200˚C	FA
		Reinforced	For use where high tensile strength is required without added weight. Tensile strength approximately. Two times as strong as that of the CT Series.	-20˚C to 200˚C	BT
	Bearing Roller Series - Standard		With a low coefficient of friction and high allowable roller load, a chain two sizes smaller may be used.	-20˚C to 80˚C	B-DT
					B-AT
	Bearing Roller Series - Lube Free		With a low coefficient of friction and high allowable roller load, a chain two sizes smaller may be used. EBR-DT/EBR-AT: lube free, WEBR: lube-free and water resistant, KEBR: lube free and heat resistant.	-20˚C to 50˚C	EBR-DT, EBR-AT
				0˚C to 50˚C	WEBR
				300˚C	KEBR
	Bearing Bushing Series		For use with equipment for which where even slight elongation is unacceptable. Assures smooth movement and accurate positioning.	-10˚C to 60˚C	RFN
	Lube free and low noise		Plastic type roller, self lubricating.	-20˚C to 80˚C	RFC-Lambda
Corrosive Environments	DP		Special surface coating on top of zinc base coating.	-20˚C to 200˚C	DP
	Stainless 400 Series	Standard	For use in sanitary environments where high temperatures are present. Long life. Avoid alkali environments.	-70˚C to 600˚C	*NT
		Plastic Roller Series	Self-lubricating, low coefficient of friction, low noise, lightweight and anti-corrosive. Avoid alkali environments.	-20˚C to 80˚C	NTP
		Reinforced	With a tensile strength 1.6 times as strong as that of the NT Series, it is useful where a light-weight, strong chain is required.	-70˚C to 600˚C	*PT
	Stainless 300 Series	Standard	For high temperature, strictly sanitary environments, and for rust prevention.	-100˚C to 700˚C	*ST
		Plastic Roller Plastic Sleeve	Self-lubricating, low coefficient of friction, low noise, lightweight and highly anti-corrosive with a long life that is completely free of oil.	-20˚C to 80˚C	STP RFS
Light Corrosive Environments	Corrosion resistant between bushing and roller	Standard	Increased wear resistance between bushing and roller, tolerance of slightly wet conditions.	-20˚C to 200˚C	KT
		Plastic Roller Series	Self-lubricating, low coefficient of friction, low-noise, lightweight for use in sanitary environments with slightly wet conditions.	-20˚C to 80˚C	KTP
	Wear and corrosion resistant between pin and bushing	Standard	Corrosion resistant between pin and bushing with an increased wear life	-20˚C to 200˚C	MT
		Reinforced	Stronger than the MT Series.	-20˚C to 200˚C	VT
	Corrosion resistant between pin, bushing and roller	Standard	Corrosion resistant between pin and bushing, and between bushing and roller. Effective for applications in water.	-20˚C to 200˚C	RT
		Plastic Roller Series	Low noise, lightweight, low coefficient of friction with a longer wear life than the RT Series.	-20˚C to 80˚C	RTP
		Reinforced	Tensile strength approximately two times as strong as that of the RT Series.	-60˚C to 450˚C	*YT
Others			From our wide selection, we can select a suitable chain material to match your requirements.	-	-

* Note: Please consult Tsubaki Technical Support if temperatures reach 400˚C or greater.

RF Metric Series Chain Introduction

RF CONVEYOR CHAINS

FEATURES

1) Wide Selection
Thousands of combinations of steel materials and specifications of component parts are available in addition to standardized chain specifications.

2) Quick Delivery
RF Conveyor Chains, even if made of special alloy steels, are standardized in the respective stages from design to production and are always carried in stock in large quantity to ensure quick delivery.

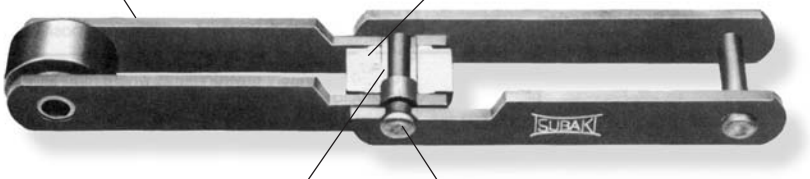
3) High Quality
RF Standard Conveyor Chains have uniform and high quality based on our ever improving production technology and standardization. This high quality gives longer life and reduced maintenance costs.

CONSTRUCTION OF RF CONVEYOR CHAINS

The RF Conveyor Chains are the basic TSUBAKI Conveyor Chain line.

LINK PLATES
Link plates are the component parts receiving chain tension. The holes for press-fitted pins or bushings are accurately punched to maintain uniform pitch.

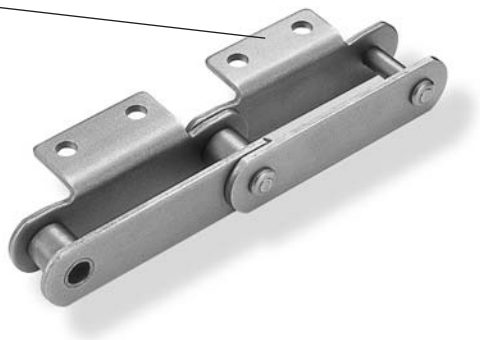
ROLLERS
Rollers are free to rotate over the bushings. When the chain engages with the sprocket, rollers work as bearings and serve to reduce shock and wear. When the chain is running on rails or wear strips, the rollers reduce running friction on the chain.



BUSHINGS
Bushings are made to obtain high wear resistance then press-fitted to the roller link plates, providing a bearing surface for pin rotation.

PINS
Pins are made to exact specifications for high strength, sturdiness and wear resistance, then rigidly press-fitted to the link plates. Pins resist shearing force through chain tension and rotate in the bushings, providing bearing surfaces when the chain articulates over a sprocket.

ATTACHMENT LINKS
Attachments are provided when necessary for fixing attachments to the chain.



Easy detachable T-pins are used on every pin to facilitate easy disconnection at the required link. Connecting links are not necessary.

RF Metric Series Chain Introduction

TSUBAKI CONVEYOR CHAINS

TYPES OF ROLLERS

TSUBAKI Conveyor Chains have three basic types of rollers. Illustrated below are examples used with guide rails.

1) R ROLLERS

Outside diameter of roller is larger than the height of the link plate, so the chain can roll on the guide rail. R Rollers are suitable for carrying large and heavy materials.

2) F ROLLERS

Flanged rollers serve to retain the chain on the rails. F Rollers are also suitable for carrying large and heavy materials.

3) S, M and N ROLLERS

The outside diameters of the S, M and N rollers are less than the height of the link plate and are specified depending on the application. The M Roller is a little larger than the S Roller, but the same size as the N Roller. For chains with the N Roller, the pin diameter is a little larger than that of the M Roller chain.

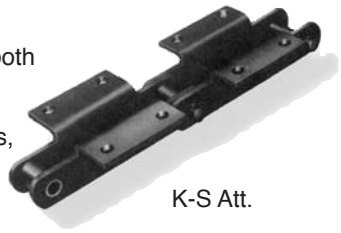
TYPES OF ATTACHMENTS

Various types of chain attachments can be provided according to the application and the size and shape of the material to be conveyed. Some of them are standardized with the A, K, SK and G Attachments. For details and dimensions, see pages C-129 - C-138. Attachments can be assembled at any required spacing.

STANDARD ATTACHMENTS

1) K Attachment

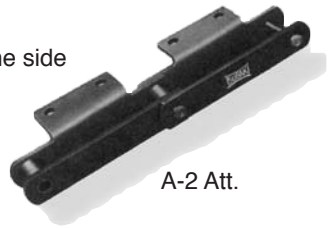
K Attachment: bent type link plate on both sides. K-1, K-2, or K-3 indicates K Attachment with one, two or three holes, respectively.



K-S Att.

2) A Attachment

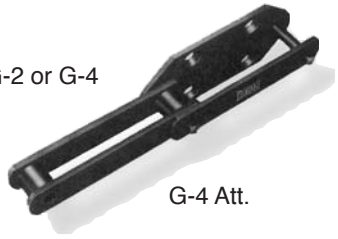
A Attachment: bent type link plate on one side only. A-1, A-2, or A-3 indicates A Attachment with one, two or three, holes, respectively.



A-2 Att.

3) G Attachment

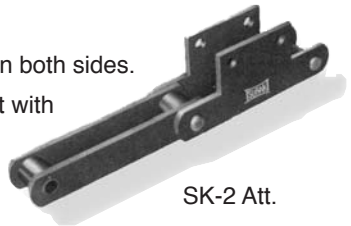
G Attachment: Link plate with holes. G-2 or G-4 indicates G Attachment with two or four holes, respectively.



G-4 Att.

4) SK Attachment

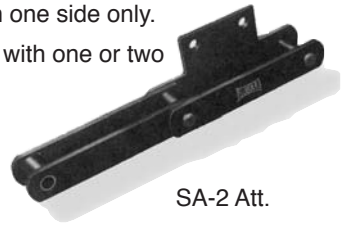
SK Attachment: straight attachment on both sides. SK-1 or SK-2 indicates SK Attachment with one or two holes, respectively.



SK-2 Att.

5) SA Attachment

SA attachment: straight attachment on one side only. SA-1 or SA-2 indicates SA Attachment with one or two holes, respectively.



SA-2 Att.

Notes:
* denotes that value in round brackets ( ) for link plate thickness is when 300 series stainless steel is used.

RF Metric Series
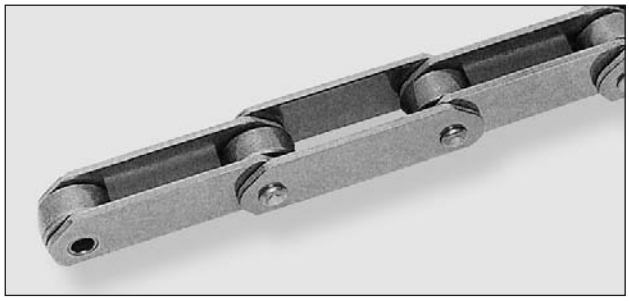
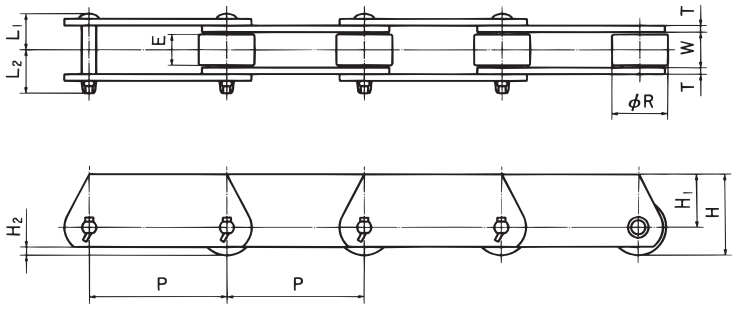
Deep Link Chain

RFD Chain provides solid contact between the chain and the material to be conveyed. In it's construction, the side plate is higher than the top of the roller. Friction is reduced because the roller will rotate over the chain guide rail. Typical applications include conveying thick plate or section steel in steel mills and also in automotive or container assembly lines.





All dimensions are in mm unless otherwise indicated.

RF Metric Series
Side Roller Chain

This chain is based on the standard S roller type conveyor chain. The pins have been extended to produce flanged side rollers on both sides. The sprockets engage the standard S roller at the chain center. The side rollers are for running and supporting the load. When ordering, specify the series name (DT Basic Series, AT, or BT) and the required interval spacing of the side rollers.

Applications

- Installing special attachments such as pushers or tilting dogs.
- Supporting heavy loads
- Installing guides for return strand of chain since special attachments interfere with the return guide.

RF Metric Series
Top Roller Chain

These chains are based on RF conveyor chain. Extra rollers are mounted on top of the chain pitch line in the middle of each link to directly support conveyed materials. These chains are used in applications such as stopping material whicle the chain is running. They are also used for the smooth transfer of material from conveyor to conveyor where conveyor speeds are considerably different. When ordering, specify the series name (DT Basic Series, AT or BT) and the required spacing of the top rollers.

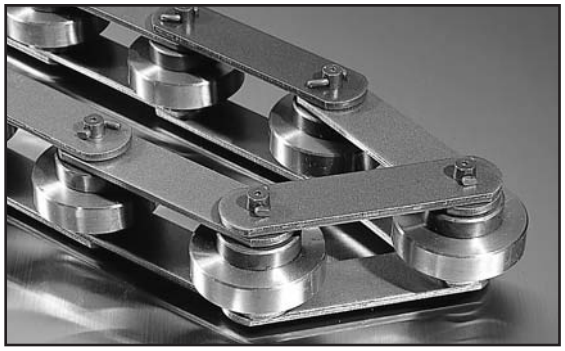
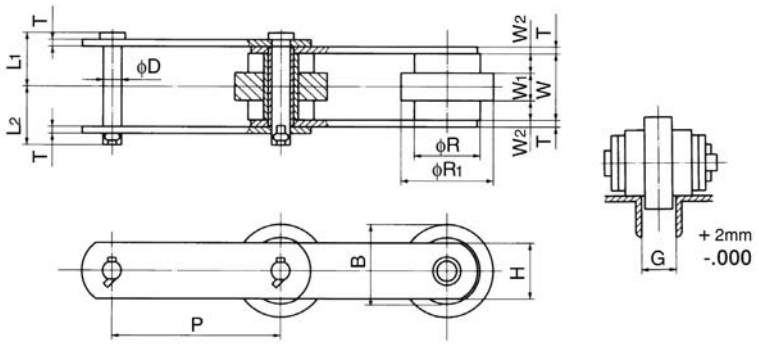
RF Metric Series
Large Size Double Plus Chain

Tsubaki's unique Large Size Double Plus free flow conveyor chain conveys objects 2.3 times faster than the actual chain speed. As a result, motor speeds up to 60% slower can be used, leading to improved system reliability and substantial reductions in energy costs and chain noise, the latter by as much as 15dB compared to side plastic roller chains. Large Size Double Plus employs a unique design, which incorporates a large centre roller, and a smaller outer roller, which supports the chain on a guide rail. When engaged, the large centre rollers (upon which conveyed objects travel) rotate at the same rpm as the small rollers. However, since the diameter of the large rollers is larger than that of the smaller ones, conveyed objects move along faster than the chain. The benefits of this unique design are that chain speeds up to 60% slower can be used without affecting the object conveying speed. Motor drive speeds can be reduced leading to substantial power savings, and to reduced noise levels some 15dB lower than those of plastic side roller chains. Added to these advantages are the excellent start-up and acceleration facilities provided by the large roller/small roller combination and the fact that Large Size Double Plus is safer than side roller chains because the chain is fully covered by a guide rail.





All dimensions are in mm unless otherwise indicated.

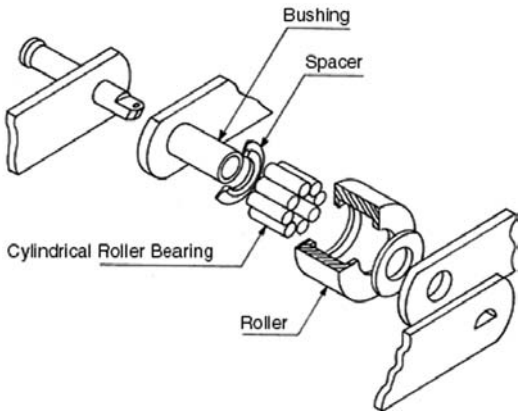
RF Metric Series
Bearing Roller Chain (Standard)

Bearing Roller Conveyor Chain is a general purpose high performance chain used for large conveyance. In this large conveyor chain, cylindrical roller bearings are installed between the bushing and roller of the RF Conveyor Chain. Applications can be found in automotive, steel, electrical, and other industries. Tusbaki's unique Bearing Roller Conveyor Chain integrates cylindrical roller bearings inside its chain rollers, reducing friction to one third of conventally constructed conveyor chain.



RF Bearing Roller Conveyor Chain has the following features:

(1) ***Lower coefficient of rolling friction***. The coefficient of rolling friction for RF Bearing Roller Conveyor Chain is one-third to one-sixth that for RF Conveyor Chain.

Basic RF Conveyor Chain: without lubrication, 0.13 to 0.18; with lubrication, 0.08 to 0.12.

RF Bearing Roller Conveyor Chain: 0.03.

This means the chain tension is reduced, and, frequently, a smaller chain size can be used. The conveyor will also require less energy to operate, making it more economical.

(2) ***The initial cost of equipment is reduced***. Because the coefficient of rolling friction is lower, you can use smaller sprockets, motors, reducers, shafts, bearings, and frames.

(3) ***The allowable load of the roller is increased***. The allowable roller load for RF12000-R Bearing Roller Conveyor Chain is about 1,880 lbs. which is 1.6 to 3.3 times greater than the equivalent size of a basic type with lubrication (560 lbs. for nonheat-treated roller; 940 lbs. for heat-treated roller). Capacity of the roller for RF12000-R Bearing Roller Conveyor Chain is equivalent to RF26200-R Conveyor Chain with heat-treated rollers. This is two sizes larger. In horizontal and slightly inclined conveying, usually the chain size is determined by the allowable load of the roller.

This means that you can select a chain two to three sizes smaller. Rollers are also exposed to high load when they engage with sprockets. Even though this load may be several times greater than the vertical load on rollers during conveying, it is within the capacity range of the bearing rollers.

(4) ***Lower maintenance. RF Bearing Roller Conveyor Chain has grease pockets on both its sides***. Although we have received reports that these chains have been operated for five years without any maintenance, we suggest that you lubricate the bearing roller occasionally.

(5) ***Longevity of the bearing roller***. The bearing roller is large in diameter and short in length; reducing the likelihood of foreign particles getting inside.

(6) ***"Stick-slip" resistance***. "Stick-slip" is virtually eliminated because of the low coefficient of friction in a wide range of speeds. Contact Tsubaki Technical Support when conveyor speed is less than 0.5m/min.

(7) ***Wide range of chain sizes is available***. Bearing roller conveyor chains are readily available in a wide range of specifications from small pitch up to larger heavy-duty sizes.

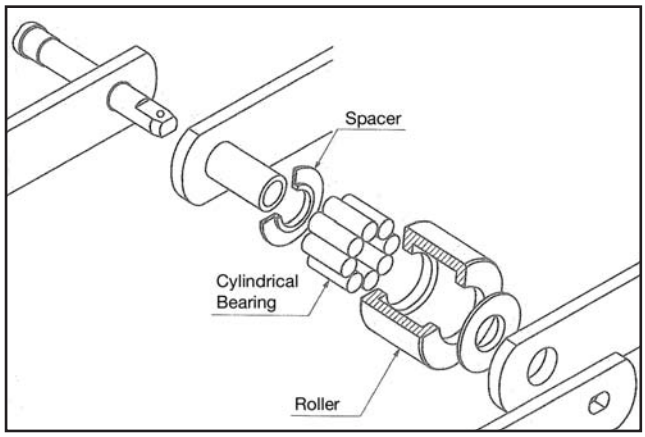
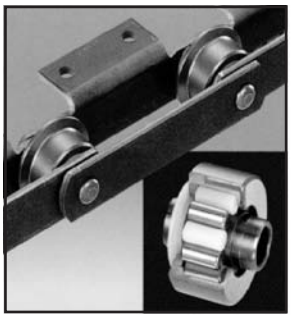
Bearing Roller Chain (Lube-Free)

Tsubaki Bearing Roller Conveyor Chain is a general purpose high performance chain used for large conveyance. In this large conveyor chain, cylindrical roller bearings are installed between the bushing and roller of the RF Conveyor Chain. Applications can be found in automotive, steel, electrical, and other industries. To respond to customer needs for longer chain life and reduced maintenance, Tsubaki also offers Bearing Roller Conveyor Chain in a "lube-free" specification.



Tsubaki offers 2 kinds of "lube-free" bearing roller conveyor chain specifications:
EBR/EBF (standard series) and WEBR/WEBF (water resistant).



EBR/EBF

WEBR/WEBF

Basic Series Specification (EBR/EBF):
Identical construction to Standard Bearing Roller Conveyor Chain (non-lube free). Alternating steel and resin cylinder bearings allow lube-free functioning.

Water Resistant Specification (WEBR/WEBF):
Modified construction/materials of the Standard Bearing Roller Conveyor Chain (non-lube free). Alternating steel and resin cylinder bearings provide lube-free operation in wet conditions.

Selected Applications:

EBR/EBF Lube-free Basic Series
- Automobile assembly lines
- Paper manufacturing and paper related businesses
- Manufacture of building materials
- Electrical and household appliance assembly lines

WEBR/WEBF Lube-free Water Resistant Series
- Automotive shower testing or washing lines
- Food products
- Paper manufacturing and paper related businesses
- For outdoor applications and wet environments

RF Metric Series
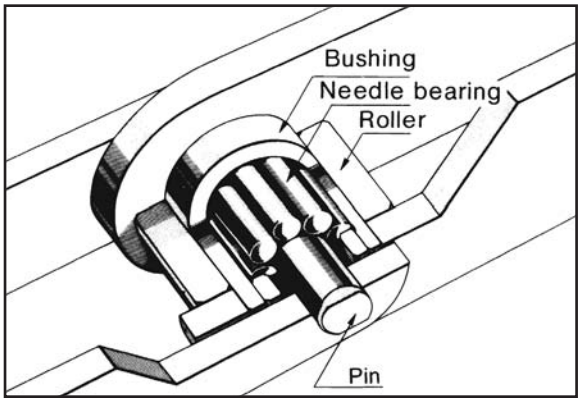
Bearing Bush Chain

Bearing Bush Chain is used in automatic assembling, packaging, filling, and parts installation for a variety of industries, including electric, electronic, semiconductor, automobile, and food as well as in other precision machinery. It includes the following features:

- High accuracy and no elongation.
- Interchangeability with other double pitch roller chains and large pitch conveyor chains.
- Long wear life without lubrication.

Usually chains are designed with gaps between the pins and bushings for proper operation. With Bearing Bush Chain, needle bearings are installed between the pins and bushings. These add rolling elements between these components and eliminate the sliding friction. Immediately after installation, the chain stretches a little (less than 0.03%) to fit the contacting surface of chain parts. After that, it doesn't stretch.
Major dimensions of the Bearing Bush Chain and attachments are the same as our ANSI standard double pitch conveyor chains (RF Type Standard Conveyor Chains). Tsubaki Bearing Bush Chain works perfectly with standard over-sized roller sprockets.
Changeover from standard roller chains to Tsubaki Bearing Bush Chains can be accomplished with minimal redesign of equipment.



RF Metric Series
Flow Conveyor Chain

Introduction:

Flow Conveyor Chain moves bulk materials in a closed case. It conveys the particles horizontally, on a slight incline, or vertically in an arrangement shaped like the letter L. Generally, a flow conveyor is used widely in the conveyance of bulk materials such as cement and fertilizer in chemical industries, and grain in food industries. Because it is enclosed, dust from the conveyed materials is contained, and will not pollute the surrounding area. A flow conveyor is not usually used to move sticky, dusty, or low-density products.

Construction and Features:

Specially shaped attachments with large clearances are installed on small pitch or large pitch conveyor chains. The chain operates in a casing filled with conveyed material, such as grain, flour, or ash.

In the flow conveyor, the attachments work as moving walls, and the conveyed material moves along with it. To lift conveyed objects, the friction at the bottom wall of the conveyor must support the weight of the vertical portion, therefore, the conveyor must have a bottom line "L" shape.

Because there is very little relative movement among the conveyed materials in this application, breakage is rare. The case width is determined by the attachment dimensions; usually it is less than 750 mm.

Standard sprockets for RF-type conveyor chain are used for flow conveyors.

Selection and Handling:

(1) There are several types of attachments available, depending on design and arrangement of the conveyor and whether material pushed against the bottom of the casing or its side walls. The specific properties of the material conveyed determine the type of attachments that should be used. Refer to the application chart below and also discuss your application with Tsubaki Technical Support.

(2) KL-type attachment is an inclined version of an L attachment. This attachment can convey low-density and sticky materials.

(3) In grain applications, installation of a cleaner prevents mixing of different types of grains, and the cleaner removes any particles in the casing that could go bad. Usually the cleaner is installed at intervals of 6 m.

(4) An M-roller, which rotates more smoothly than an S-roller, is typically used in the base chain.

Attachment	Application
L	Conveying grain or cement
KL	Conveying adhesive powder
B (round)	Conveying powdered material like flour or cements at higher conveying efficiency than L attachment
B (square)	Conveying massive, powdered, or adhesive materials that are hard to convey with B (round) attachment
U_2V (round)	A larger conveyor than L, KL, B, or for an upgrade
U_2V (square)	Conveying massive, powdered, or adhesive materials that are hard to convey with U_2V (round)

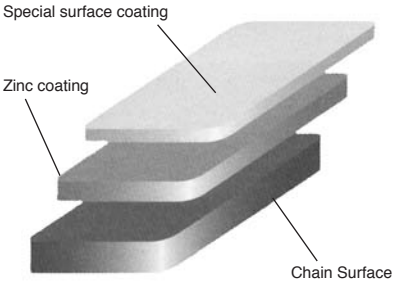
DP Coated Anti-Corrosive Chain



DP engineering class chain has been zinc galvanized and then specially treated on the surface with a coating that together provide a double plated effect. (The surface treatment is applied to each individual part of the chain before it is assembled). This highly durable chain has superior corrosion resistance to salt-water and all types of weather. There is no reduction in tensile strength as a result of coating the chain. Applications include outdoor conveyor systems, bottle washer lines, shower testers and many other applications subject to harsh environments. DP coated chain should not be used where the chain comes into direct contact with food products. Nor should it be used where the special coating flakes may mix with and or contaminate food products. In non-food applications, a cover should be used where the coating flakes or where dust may pose a problem.

DP Engineering Class Chain Specifications:

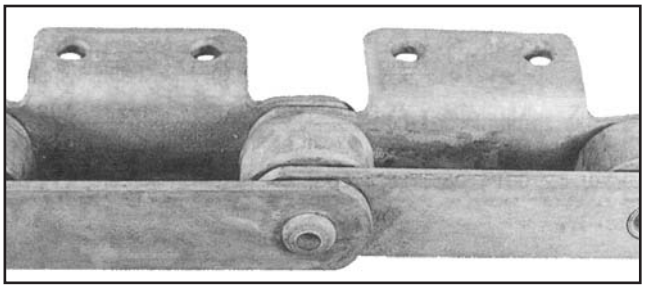
Chain Size	RF03 – RF36 (and MTO chains)
Chain Series	Coating can be applied to any chain material including stainless steel.
Working Temperature Range	-20˚C - +200˚C
Colour of Coating	Silver

Corrosion Resistance Specifications:

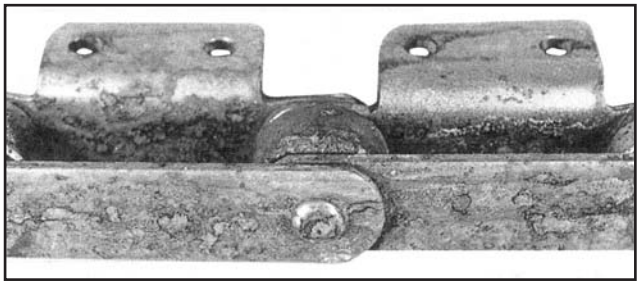
DP coated chain has 5 times greater corrosion resistance than zinc plated chain and 20 times greater corrosion resistance than nickel plated chain.

In house Corrosion testing (salt water):

DP Conveyor Chain
(120 hours – no rust)



Nickel Plated Conveyor Chain
(120 hours – corroded)



Zinc Plated Conveyor Chain
(120 hours – very corroded)

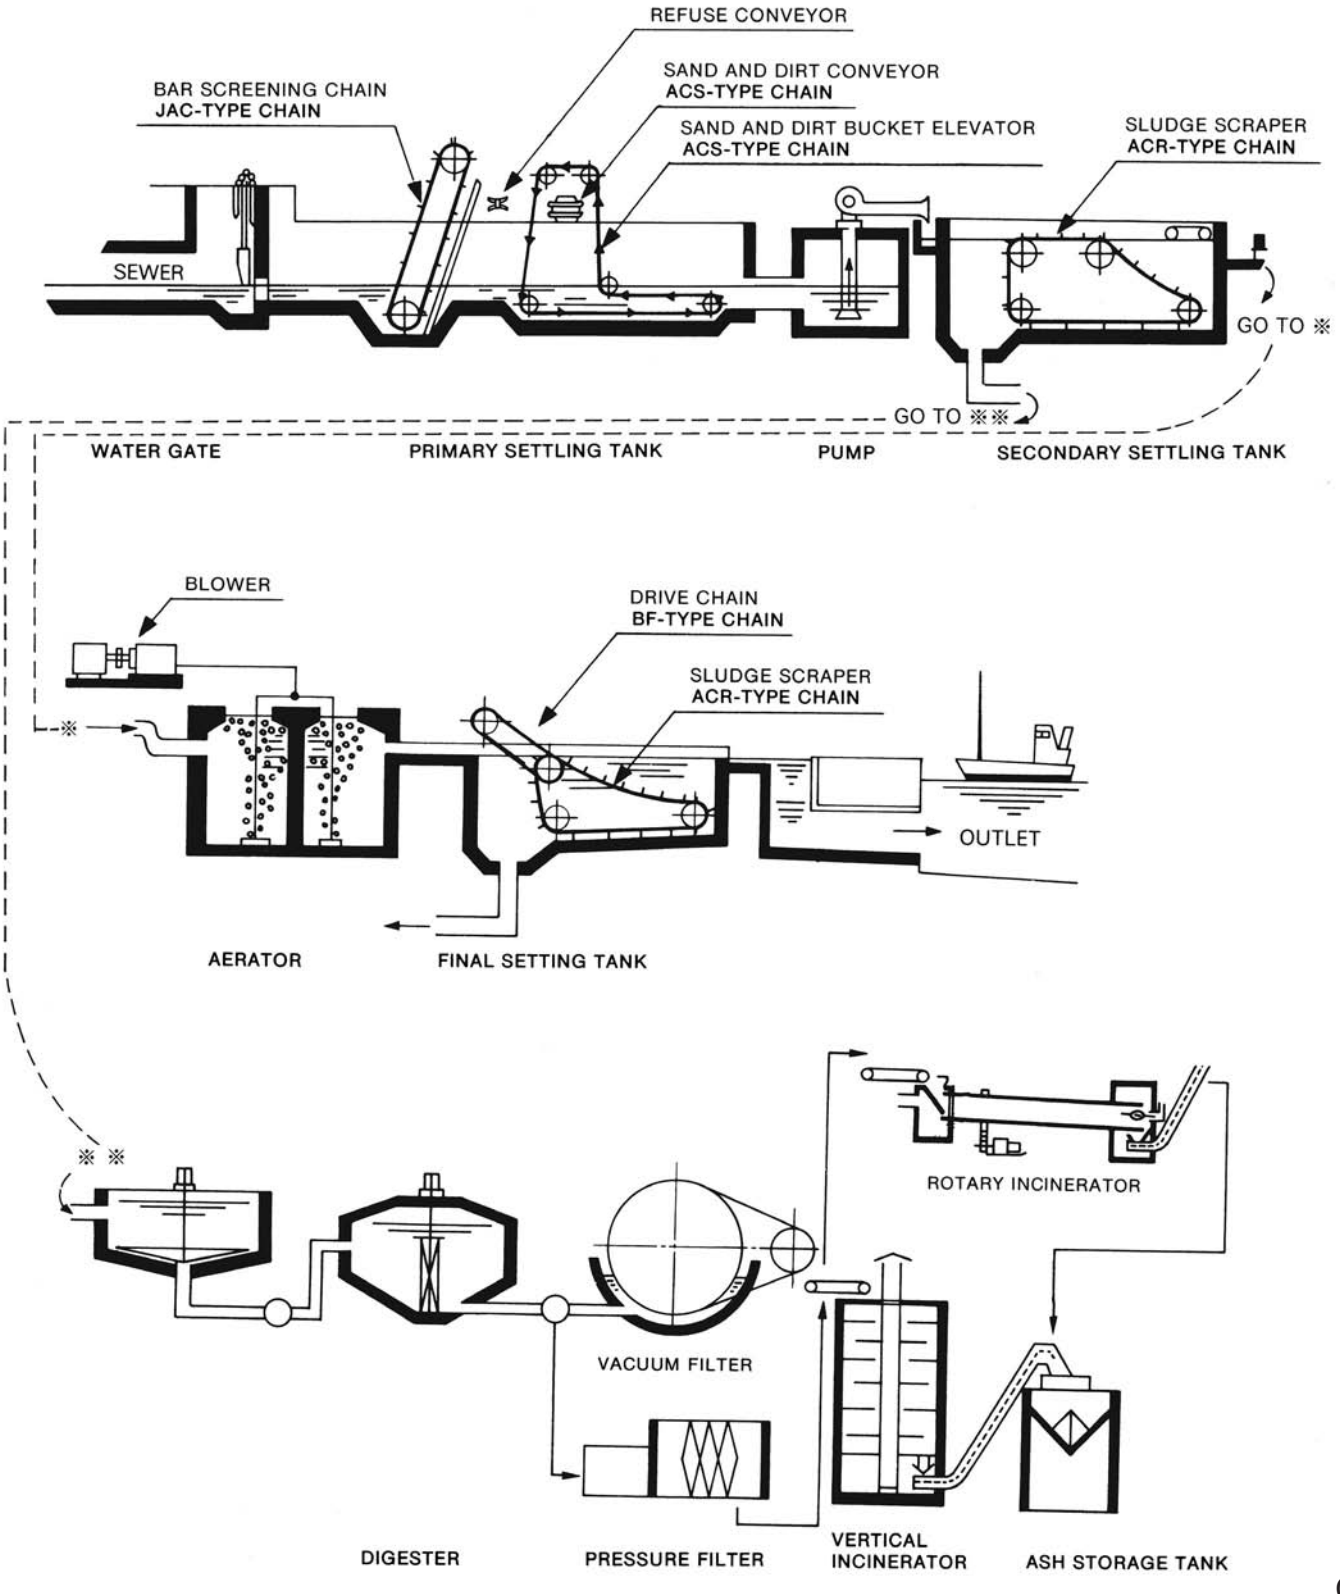
Sewage Treatment Chain

Sewage Disposal Process

One of the main uses of large pitch conveyor chain is in water treatment facilities. In a large sewage treatment facility, sewage goes through several tanks in which solid wastes are eliminated.

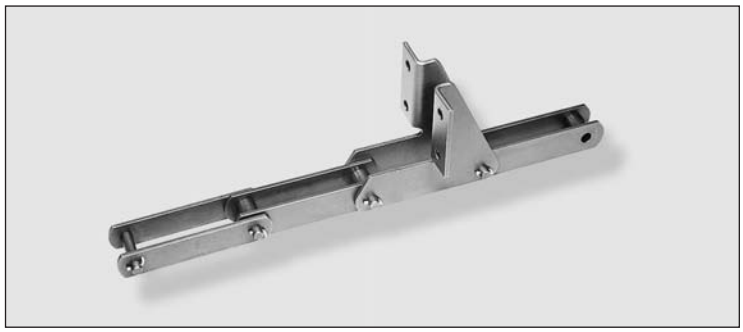


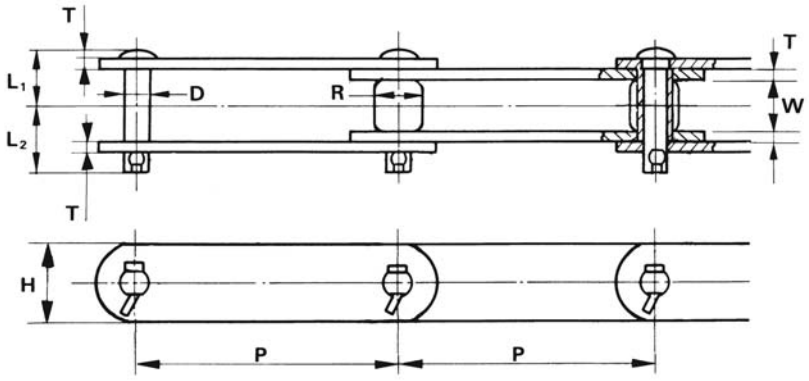
ACR Collector Tank Sewage Treatment Chain

Chains used in water treatment applications are operated at low speeds and not subjected to any heavy shock loads.

For that reason, ACR chains were developed:

ACR Chain is a small chain made of type 403 stainless steel. This was the first chain to be used in scraper applications to be equipped with rollers. The rollers reduce wear on the sprocket and the chain. Insert-tooth sprockets have been developed for this chain as well.





All dimensions are in mm unless otherwise indicated.

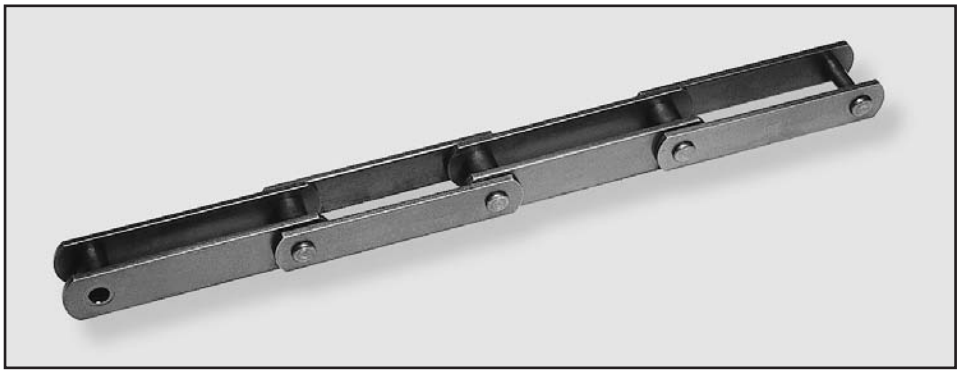
ACS Collector Tank Sewage Treatment Chain

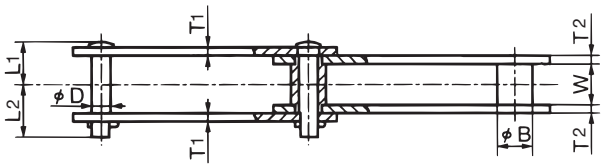
In the silt tank, sand and dirt are removed using vacuum or V-buckets. In the settling tank, sludge in the water, or on its surface, is scraped to the exit with "flights" (boards) installed between two strands of chains at intervals of 3 m. Sewage Treatment Chain (ACS Chain) is used in this process. Accumulated dirt is removed with pumps. ACS stainless steel chains assure excellent corrosion resistance, so there is no need for old-style extra-heavy cast iron chains. This chain is also used to convey corrosive objects in general scraper conveyors. ACS Chain has large-diameter bushings. It does not have rollers. Plates, pins, and bushings are made of type 403 stainless steel and all these components are press-fit. The T-head cotter key is made of type 304 stainless steel, which ensures high corrosion resistance. SF-4 attachments are used for installing flights, and extended pins or LA-1 attachments for installing buckets in the dredger. Both of these attachments are placed on the outer plates. LA-1 attachments are made of heat-treated carbon steel.

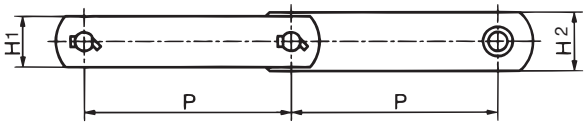
Selection and Handling:

(1) The chain speed of a scraper application is slow, 0.3 to 0.6 m/min., and 3 m/min. in the bucket application. The chain tension is the highest during the test period, before water is poured into the tank. Before water is poured into a 40-m tank, one chain is exposed to tension of 10,000 kgf.

(2) The Type 403 stainless steel chain has sufficient corrosion resistance for most sewage facilities. If there is a high concentration of chlorine (as found in sea water, for example), if there are high levels of sulfur from hot springs, or if the tanks are contaminated, 304 stainless steel should be used, at least for side plates.







All dimensions are in mm unless otherwise indicated.

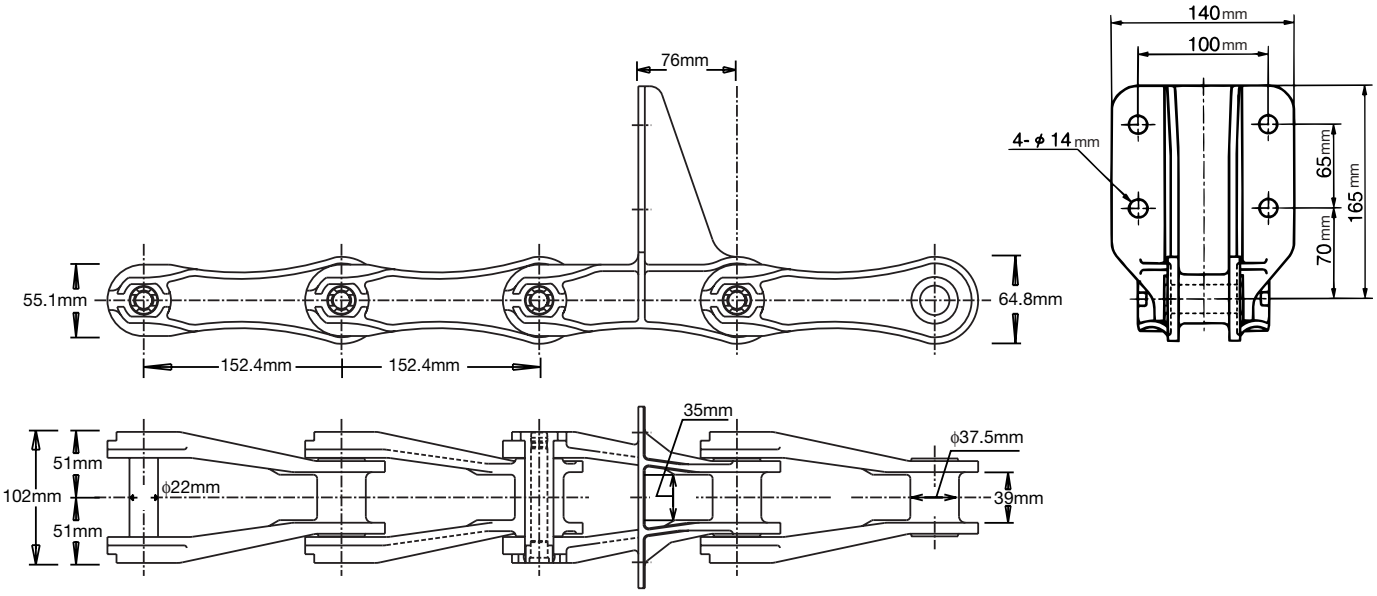
ACP Collector Tank Sewage Treatment Chain

Chains used in water treatment applications are operated at low speeds and not subjected to any heavy shock loads.
For that reason, ACP chains were developed: Engineered plastic ACP chain is a light-weight chain with high corrosion resistance. It does not have rollers (similar to cast iron chain). Due to its light weight (one-half to one-fourth the weight of stainless steel chain), installation is relatively simple. One of the problems with this chain is that engineered plastic expands and contracts as the water temperature changes. Therefore, it is difficult to keep the chain under constant tension. Average Tensile Strength of ACP chain is much lower than either cast iron or stainless steel chain.



Chain Number	Average Tensile Strength (kgf)	Approximate Weight (kg/m)	Additonal Weight per Attachment (kg)
ACP04152-SF4	4,000	2.9	.25
ACP04152P-SF4	3,000	2.4	.25

JAC Type Bar Screen Sewage Treatment Chain

At the water gate of sewage treatment plants, there are gratings (called bar screens) arranged lengthwise to catch floating objects. In addition to water treatment plants, bar screens may be installed at the mouths of rivers. In some bar screen setups, chains are set on guide rails and used as wide gratings or screens. Eventually gratings fill up with contaminant's, and they have to be cleaned. A comb-shaped rake installed between two strands of chain is used for this purpose.

Construction and Features:

(1) Bar Screen Chain is constructed like roller chain. There are several specifications in this kind of chain. Select the appropriate type based on the corrosiveness of the operating environment.

(2) VJ and PJ attachments are made of heat-treated steel except the Type 304 stainless steel SJ attachment.

(3) S-rollers and F-rollers may be used with this chain. The difference between the two include the following points: S-roller: Adapted to a rake with wheels. The rake rotates and sweeps out the waste. (This is sometimes called a rotating-rake design.) F-roller: Adapted to the rake without wheels. The rake is fixed on the chain. The F-rollers support the weight of the rake. In an F-roller set-up, the flange may alternate sides every one or two rollers. This arrangement prevents derailment. Each chain attachment is exposed to high load, because there are only two or three rakes installed on the chain. Y attachments are used in the rotating-rake design, and A-2 (Type I) attachments are used in the fixed rake type. The A-2 (Type II) attachment is used for scrapping mud and sand at the bottom of the collector tank. All attachments have additional features that increase their strength: the end of the connecting pin is threaded and equipped with a nut to prevent it from falling off.

Bar Screen Selection Table

Series	Materials and Heat-Treatment			Standardized Attachment
	Pin Bushing	"S" Roller Link Plate	"F" Roller	
VJ[1]	400 Series, stainless steel heat-treated	alloy steel, heat-treated	alloy steel, heat-treated	Y, A-2(I), A-2 (II)
PJ	400 Series, stainless steel, heat-treated			Y, A-2(I), A-2 (II)
SJ	300 Series, stainless steel			A-2(I), A-2 (II)

RF Metric Series Chain Selection Guide

TSUBAKI

INTRODUCTION TO TSUBAKI CONVEYOR CHAINS

NAME	FEATURES	APPLICATION
RF Conveyor Chain	Most popular and economical	Standard
Bearing Roller Series	Two chain sizes smaller Minimum maintenance	Compact applications High allowable roller load
RF Type Bucket Elevator Chain	Wear resistant High fatigue resistant	Cement bucket elevator
BF Type Bucket Elevator Chain	Wear resistant High fatigue resistant	Cement bucket elevator
Flow Conveyor Chain	A variety of attachments standardized for material handling	Conveying bulky materials
NF Flow Conveyor Chain	Strong and highly abrasion resistant	Abrasive, high-temperature and high-humidity environments
RF Conveyor Chain with Side Roller Chain	Stable operation	Special attachments and outboard rollers support heavier loads
RF Conveyor Chain with Top Roller	Conveys and accumulates materials	Assembly and transport lines
NF Block Chain	Strong and compact, highly wear resistant	Pushing trucks conveying hot materials and drawbench
RFD Deep Link Chain	Direct loading	Conveying heavy materials in steel and automobile assembly lines, etc.
Water Screen Chain	Through-hardened stainless steel pins and bushings; rollers have special bushings for smoother operation and longer service life, anti-corrosive	Water inlet screening processor at paper and steel mills, water purification plants, etc.
Sanitation Chain	Strong stainless steel chain which is both lightweight and highly corrosion resistant	Sewage disposal and processing
Tooth Insert Sprockets for Sanitation Chain	Minimal maintenance corrosion resistant low operation costs	Sewage disposal and processing

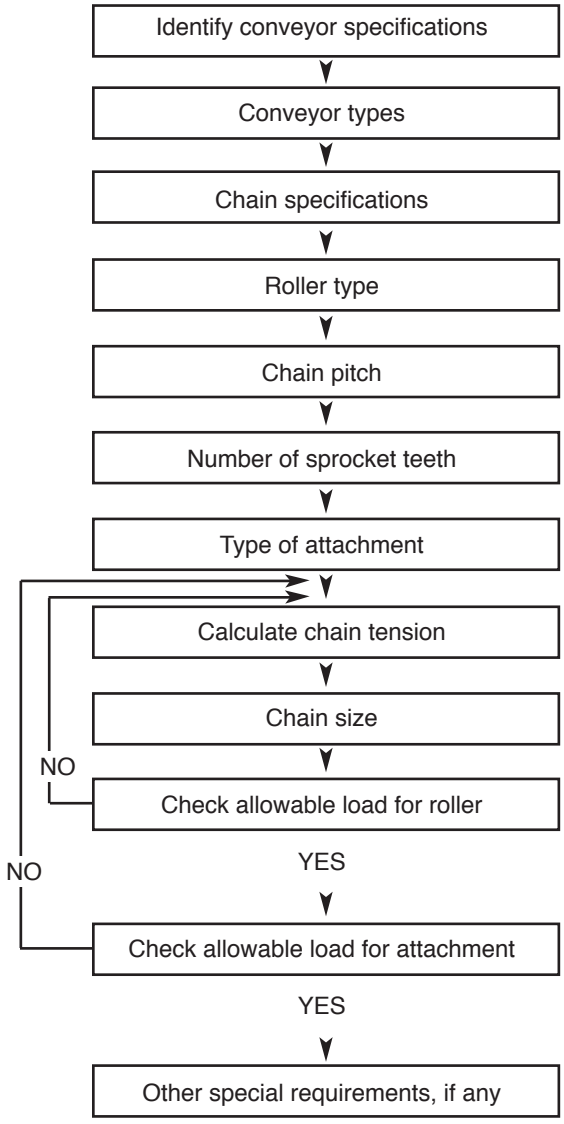
RF Metric Series Chain Selection Guide

1. CHAIN SELECTION

The following are the general procedures for selecting various types of conveyor chains.

SELECTION PROCEDURE



*Please utilize INQUIRY CHART on the right.

INQUIRY CHART

Type of Conveyor:

Conveyed Material:

Corrosion:

Wear:

Temperature of Material Conveyed: °C

Size of Material Conveyed: Max

Mass of Material Conveyed: Max kg/pc

Conveying Quantity (Bulk): Max ton/h

Conveying Quantity (Unit): Max

kg

(Total mass of material conveyed on conveyor)

Center Distance Between Shafts: m

Lift: m

Number of Chain Strands: Strand(s)

Traverse Distance Between Chains: m

Average Tensile Strength: kN(kgf)

Chain Pitch: mm

Chain Speed: m/min

Attachment Type and Spacing:

Conveying Method: e.g. Material to be loaded directly to chain.

Operating Time: hrs/days

Use Lubrication: Yes/No

Motor: AC/DC kW, r/min, unit(s)

Number of Sprocket Teeth:

Bore Diameter: mm

Specifications of Boss: Type

Diameter mm

Length mm

Specifications of Keyway:

Specifications of Sprocket Teeth:

2. CONVEYOR TYPES

CONVEYOR TYPES	MATERIAL CONVEYED			
	UNIT	TYPE OF CHAIN	BULK	TYPE OF CHAIN
LOADING	Slat Conveyor	RF-B RFN RF (CT)	Apron Conveyor	RF
	Pusher Conveyor Tow Conveyor Roller Coaster	RF RFN NF RF-SR		
	Free Flow Conveyor	RF-VR RF-TR RF-SR		
	Plain Chain Conveyor	RF NF EPC RFD		
ELEVATING	Trolley Conveyor	RF	Bucket Elevator	RF B-type
	Tray Elevator	RFN RF NF	Bucket Type Continuous Unloader	Special Chain
	Tower Parking	RF Special Chain		
PUSHING OR CONVEYING WITH FRICTION			Scraper/Flight Conveyor	RF
	Pusher Conveyor	RF NF RFD	Flow Conveyor	RF NFX
	Horizontal Circulating-Conveyor	RF RFN	Drag Conveyor	Special Chain

Note: Please refer to Table 1 (page C-181) for the wear and corrosive characteristics of materials conveyed.

3. CONVEYOR CHAIN SPECS

When selecting the type of conveyor chain, it is necessary to identify the physical properties of the materials conveyed. Then, the conveying method and the type of chain conveyor should be determined, considering cost performance.

Key Points in Determining the Type of Conveyor Chain

1) To reduce the running resistance of the conveyor chain when conveying material, a Loading Type Conveyor is adopted. Energy saving can be achieved with this conveyor. Bearing Roller Chain and CT Chain are most suitable for this application.

2) Powdery or dusty material should be conveyed in a sealed casing such as with Flow Conveyor.

3) When material conveyed is very abrasive, the conveyer should be designed to prevent the material from directly contacting the conveyor chain. If this cannot be done, the chain speed should be reduced as much as possible.

4) When the chain is used in corrosive conditions refer to table 13 on page C-192 to select a suitable chain material.

4. ROLLER TYPE

The most suitable type of roller should be selected according to the requirements of the application.

	F roller	R roller	S.M.N. roller
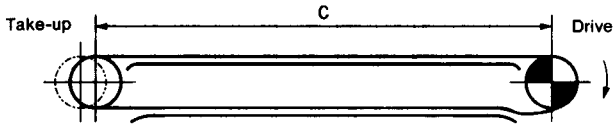
TYPE			REMARKS	*Most basic type *Less friction *For large and heavy materials *Long center distance	*Lateral movement to be avoided *Long center distance *Less friction	*Lower cost *For light conveyor *Vertical conveyor *Shorter center distance

5. BASIC LAYOUT OF CONVEYOR CHAIN

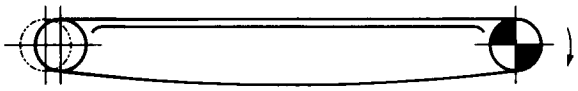
Horizontal Conveyor

1) A catenary is made on the drive sprocket side.



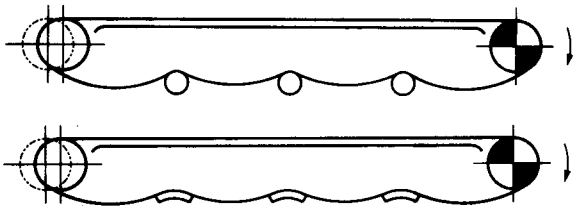
Tension of the catenary makes chain-sprocket engagement smooth. Lubrication at the catenary is effective.

2) No guide on return side



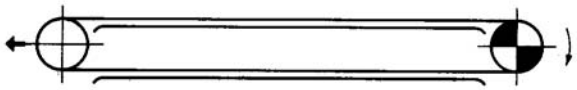
For short center distance and slow chain speed. The mass of the chain on the return side may cause vibration and this affects chain operation.

3) To support the chain on return side by guide or roller.



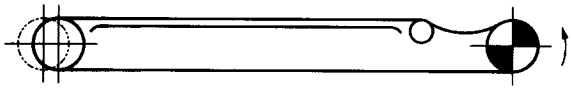
Contact between chain and guide or roller may enhance wear of chain or damage chain as chain articulates at the roller or guide. This may also cause vibration and affect chain operation. In case of a long center distance, it is practical to divide the return side into several catenaries. Catenary sag can absorb chain elongation/shrinkage by heat, etc. This arrangement can be used when chain speed is comparatively slow and the catenary sag should be about 10 percent of free span. This cannot be recommended for reverse drive.

4) To support all the return side

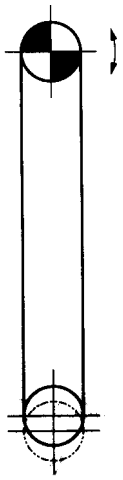


Chain sag should be adjusted regularly by take-up as there is no catenary. This arrangement can be used for reverse drive.
Caution: If tension given by take-up is excessive, it will increase wear of chain.

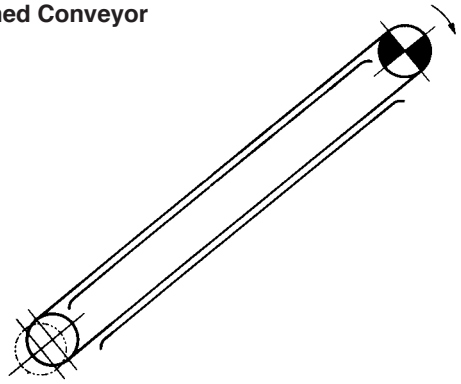
5) Tension side under type



Vertical Conveyor
When the conveyor stops while loaded, it is necessary to install a brake or Tsubaki Back Stop Cam Clutch on the drive side.
Caution: If tension given by take-up is excessive, it will increase wear of chain.

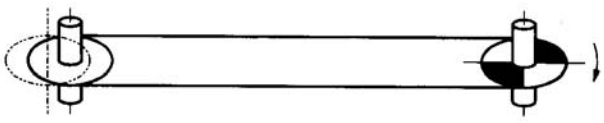


Inclined Conveyor



Vertical Shaft Conveyor

Installation of guide roller makes chain running smoother.



6. CHAIN SPECIFICATIONS FOR CONVEYING BULK MATERIALS

Table 1 shows popular types of conveyor and recommended chain specifications. The properties of the listed material are not always the same. Type of conveyor and specifications of chain should be determined taking this point and past performance into consideration.

RF Metric Series Chain Selection Guide

Table 1: Material and Chain Specifications

Material	Abrasive-ness	Corrosive-ness	Type of Conveyor				Recomm. Chain Series
			Scraper	Flow	Apron	Bucket	
Rice	C	C	O	O		O	DT

Note: Abrasiveness – A B C
Corrosiveness - A (Strong acid), B (Moderate acid), C (Neutral), D (Moderate alkali), E (Strong alkali)
Type of Conveyor – O (Common), ▲ (Sometimes), Blank (Seldom)
*GT in case of Apron Conveyor

7. CHAIN PITCH AND NUMBER OF SPROCKET TEETH

1) Smoother chain operation can be expected as the number of sprocket teeth increases. This means that for a sprocket with the same outer diameter, a shorter pitch chain can operate more smoothly due to a reduction in the polygonal speed fluctuation or less articulating angle of chain on the sprocket. This also results in less wear between pin and bushing.

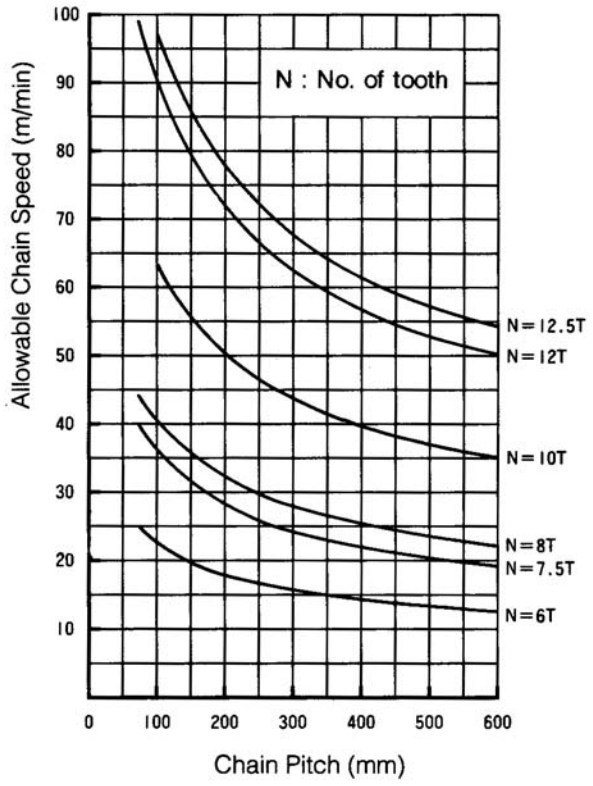
2) Longer pitch chain, though more expensive per link, would be cheaper for a unit length of chain in general. Chain pitch for Unit Conveyor is determined by unit size or attachment spacing.
(Example) Attachment spacing = 2 m
*Chain pitch = 100, 200, 250
*Chain pitch can be selected by dividing attachment spacing by an even number.

3) The chain pitch for Bulk Conveyor is determined not only by material itself, but also by conveyor capacity. Conveyor capacity is determined by sizes of bucket, apron, scraper, etc. Chain pitch is in turn determined by these sizes.

4) Space limitation should also be kept in mind when selecting sprocket.

5) Chain pitch relates to the number of sprocket teeth and chain speed shown in Table 2.

Table 2: Chain Pitch and Allowable Chain Speed



8. TYPE OF ATTACHMENT

Please refer to pages C-129 - C-131.

9. CALCULATE CHAIN TENSION

Maximum static tension to chain, T max, during operation can be calculated using the formulas in Table 3. The formulas are based on mass M (weight W) X friction factor. In the following cases, inertia becomes very large, and the tension and required kW should be calculated while considering the inertia.

Sudden start or stop in high speed conveyor
Sudden load in pusher conveyor, etc.

9.1 Terms

T_{max} : Maximum static tension to chain: kN (kgf)
T : Static tension to chain: kN (kgf)
Q : Maximum conveying quantity: t/h (tf/h)
V : Chain speed: m/min
H : Center distance between sprockets (Vertical): m
L : Center distance between sprockets (Horizontal): m
C : Center distance between sprockets (Inclined direction):m
m(W) : Mass (weight) of conveying device (Chain X Strands, Buckets, Apron, etc.): kg/m (kgf/m)
f_1 : Friction factor between chain and guide rail (Tables 5 and 6)
f_2 : Friction factor between material conveyed and casing (Table 7)
f : Material to be loaded directly to chain: f = 1
Material to be scraped: f = (f_2/f_1)
g : Gravity acceleration : 9.80665m/s^2
M(W) : Mass (Weight) of material conveyed : kg/m (kgf/m)
(Bulk)

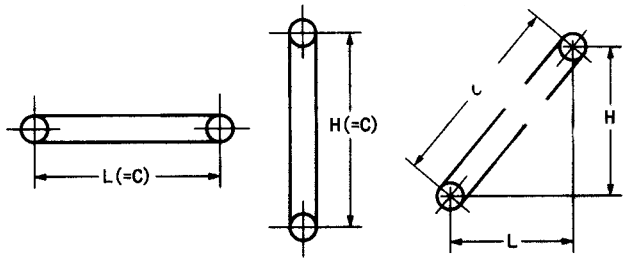
$$M = *16.7 \times Q/V \quad (w = 16.7 \times Q/V)$$

(Unit)

$$M = \frac{\text{Mass of material conveyed (kg/pc)/Loading spacing}}{\text{Loading Spacing (m)}}$$

$$W = \left(\frac{\text{Weight of material conveyed (kgf/m)}}{\text{Loading Spacing (m)}} \right)$$

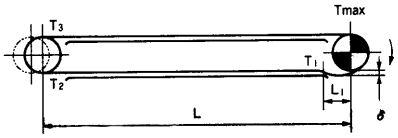
*Factor to get mass (weight) per meter, 16.7 = 1000/60



9.2 Calculate Chain Tension (Table 3)

Horizontal Conveyor

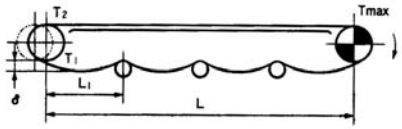
SI Unit	Gravimetric Unit
$T_1 = 1.35^{*1} \times m \times L_1 \times g/1000$ (kN)	$T_1 = 1.35 \times \omega \times L_1$ (kgf)
$T_2 = (L-L_1) \times m \times f_1 \times g/1000 + T_1$ (kN)	$T_2 = (L-L_1) \times \omega \times f_1 + T_1$ (kgf)
$T_3 = 1.1^{*2} \times T_2$ (kN)	$T_3 = 1.1 \times T_2$ (kgf)
$T_{MAX} = (M \times f + m) \times L \times f_1 \times g/1000 + T_3$ (kN)	$T_{MAX} = (W \times f + \omega) \times L \times f_1 + T_3$ (kgf)



*1) Refer to Table 4.

*2) 1.1 is for increase of tension at driven sprocket.

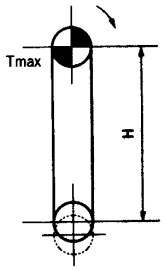
$T_1 = 1.35 \times m \times L_1 \times g/1000$ $0.1^* \times m \times L \times g/1000$ (kN)	$T_1 = 1.35 \times \omega \times L_1 + 0.1^* \times \omega \times L$ (kgf)
$T_2 = 1.1 \times T_1$ (kN)	$T_2 = 1.1 \times T_1$ (kgf)
$T_{MAX} = (M \times f + m) \times L \times f_1 \times g/1000 + T_2$ (kN)	$T_{MAX} = (W \times f + \omega) \times L \times f_1 + T_2$ (kgf)



*0.1 is coefficient of roller resistance at return side.

Vertical Conveyor

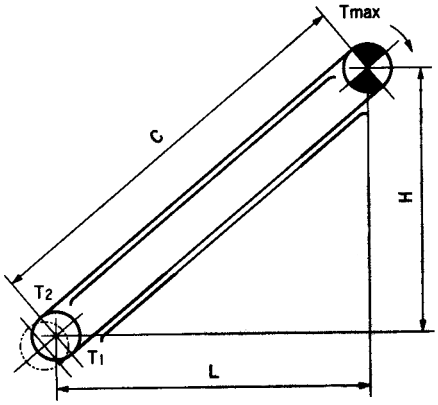
$T_{MAX} = (M + m) \times H \times g/1000$ (kN) $T_{MAX} = (W \times \omega) \times H$ (kgf)



Note: In bucket elevator, 1 m is added to center distance (H) for shock load at loading material.

Inclined Conveyor

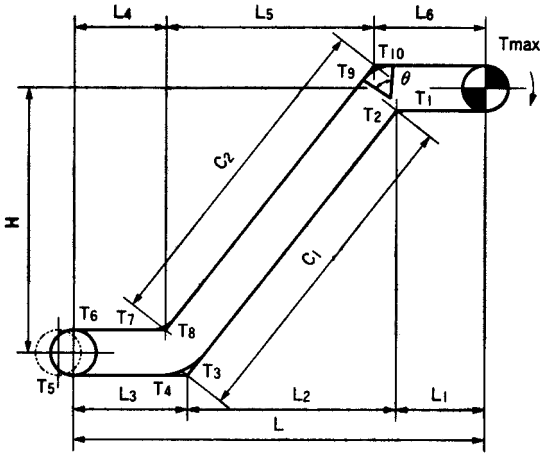
$T_1 = m (Lf_1 - H) \times g/1000$ (kN)	$T_1 = w (Lf_1 - H)$ (kgf)
When $T_1 < O$, $T_2 = 0$	When $T_1 < O$, $T_2 = 0$
$T_2 = 1.1 \times T_1$ (kN)	$T_2 = 1.1 \times T_1$ (kN)
$T_{MAX} = M (Lf_1 \times f + H) \times g/1000 + m (Lf_1 + H) \times g/1000 + T_2$ (kN)	$T_{MAX} = W (Lf_1 \times f + H) + w (Lf_1 + H) + T_2$ (kgf)



RF Metric Series Chain Selection Guide

SI Unit

Practical Example



T_1= m x L_1 x f_1 x g/1000 (kN)
T_2 = T_1 x kc_1 (kgf)
T_3 = m ($L2f_1$ – H) x g/1000 + T_2 (kN)
T_4 = T_3 x kc_2 (kN)
when T_3 < 0, T_4 = 0
T_5 = m x L_3 x f_1 x g/1000 (kN)
T_6 = 1.1 x T_5 (kN)
T_7 = (m + M x f) x L_4 x f_1 x g/1000 + T_6 (kN)
T_8 = T_7 x kc_3 (kN)
T_9 = M ($L5f_1$ x f + H) x g/1000 + m ($L5f_1$ + H) x g/1000 + T_8 (kN)
T_{10} = T_9 x kc_4 (kN)
T_{MAX} = (m + M x f) x L_6 x f_1 x g/1000 + T_{10} (kN)

Gravity Unit

Corner Factor (kc) σ: Radian

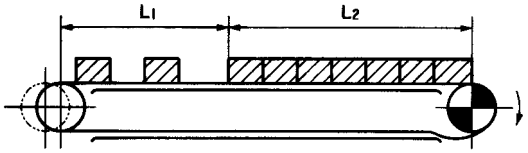
f_1 \ Angle	30°	60°	90°	120°	180°
0.03	1.02	1.03	1.05	1.06	1.10
0.10	1.05	1.11	1.17	1.23	1.37
0.15	1.08	1.17	1.27	1.37	1.60
0.20	1.11	1.23	1.37	1.52	1.87
0.24	1.13	1.29	1.46	1.65	2.13
0.30	1.17	1.37	1.60	1.87	2.57
0.40	1.23	1.52	1.87	2.31	3.51

T_1 = ω x L_1 x f_1 (kgf)
T_2 = T_1 x kc_1 (kgf)
T_3 = ω ($L2f_1$ – H) + T_2 (kgf)
T_4 = T_3 x kc_2 (kgf)
when T_3 < 0, T_4 = 0
T_5 = ω x L_3 x f_1 (kgf)
T_6 = 1.1 x T_5 (kgf)
T_7 = (ω + W x f) x L_4 x f_1 + T_6 (kgf)
T_8 = T_7 x kc_3 (kgf)
T_9 = W ($L5f_1$ x f + H) + w ($L5f_1$ + H) + T_8 (kgf)
T_{10} = T_9 x kc_4 (kgf)
T_{MAX} = (ω + W x f) x L_6 x f_1 + T_{10} (kgf)

Example using Double Plus Chain

T_{MAX} = 2.1m (L_1 + L_2) f_1 x g/1000 + (M x L_1 x f_1) x g/1000 + (M_1 x L_2 x f_3 x g/1000) (kN)

T_{MAX} = 2.1 ω (L_1 + L_2) f_1 + (W x L_1 x f_1) + (W_1 x L_2 x f_3) (kgf)



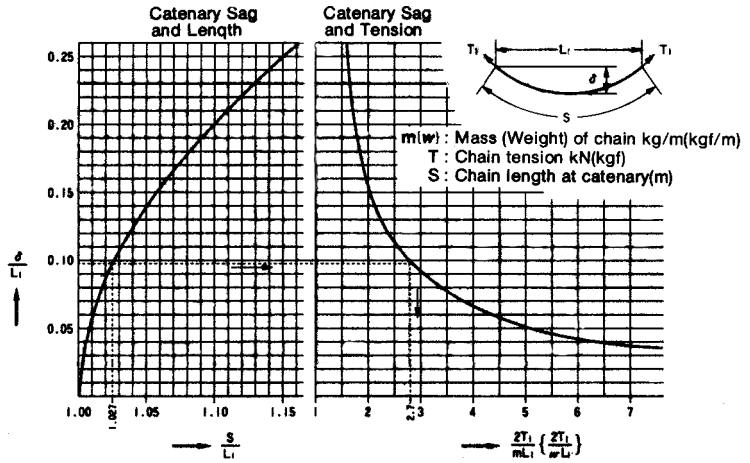
L_1: Length of conveying section (m)
L_2: Length of accumulating section (m)
M_1 (W_1): Mass of material conveyed at accumulating section (kg)
Weight of material conveyed at accumulating section (kgf/m)
f_1: Friction factor between chain and rail at conveying material = 0.05
f_3: Friction factor at accumulation = 0.2

Static tension to chain varies with layouts as follows:

Horizontal $T = T_{MAX} – T_1$
Vertical $T = T_{MAX} – mH$ x g/1000 {$T = T_{MAX} – ω H$}
Inclined $T = T_{MAX} – m (Lf1 – H)$ x g/1000 {$T = T_{MAX} – ω (Lf_1 – H)$}
When $Lf_1 – H < 0$, $T = T_{MAX}$

RF Metric Series Chain Selection Guide

Table 4 : Catenary Tension Graph



Catenary Tension
$T_1 = 1.35 \times m \times L_1 \times g/1000$ (kN)
1.35 factor in the above formula is worked out as follows:

When catenary sag is 10%, $\varepsilon = 0.10L$

Then from the graph
$\varepsilon/L_1 = 0.10 \rightarrow 2T1/mL_1 = 2.7$
$T_1 = 1.35 \times m \times L_1 \times g/1000$

Chain Length at Catenary
$\varepsilon/L_1 = 0.10 \rightarrow S/L_1 = 1.027$
$S = 1.027L_1$

Table 5: Rolling Friction Factor f_1 Between Chain And Rail

Roller diameter	Lubricated		Dry	
	R.F	S.M.N.	R.F	S.M.N.
D < 65	0.08	0.16	0.15	0.24
65 ≤ D < 100	0.08	0.15	0.14	0.23
100 ≤ D	0.08	0.14	0.13	0.22
RF214 (exception)	0.12	0.15	0.18	0.22

Conditions: Clean and room temperature lubricant ISO VG100 (SAE30-40)
The friction factor f1 between top roller and material conveyed is the same as that of R roller in the above.

Series	f_1

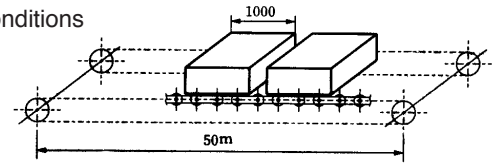
10. EXAMPLES OF CHAIN SELECTION
10.1 Bearing Roller Conveyor Chain

1) Conditions



Chain speed: 10 m/min
Material conveyed: 2000 kg/pc x 40 pcs
Chain strand: 2
Chain pitch: 250 mm
"F" roller, A2 attachment
Standard Chain (DT) is selected tentatively.

2) Selection
1. Roller Load No. of rollers = Length of material/Chain pitch = 1000/25 = 4 pcs
Chain pitch 4 pcs x 2 (strands) = 8 pcs
Considering uneven load, if only 4 rollers receive load, roller load per roller is:
2000 x g/1000 x 1/4 = 4.9 kN (500 kgf)/pc
From Table 10, the following chains can be selected:
Bearing Roller Chain = RF12250BF-1LA2
RF Standard Chain = RF26250F-1LA2

2. Allowable Loading Mass on Conveyor
Due to simplified selection, tension of conveyor weight and starting impact is not considered in the following procedure.
2000 kg x 40 pcs/2 strands = 40000kg
From the table below, RF10ton type Bearing Roller Chain and RF17ton type RF conveyor Chain can be selected.

Allowable Loading Mass Quick Reference Table
Conditions: Horizontal Conveyor, Safety Factor = 7, Friction Factor = RF type: 0.08, Bearing Roller Chain: 0.03

(kg/strand)

Chain Size	RF Chain (DT)	Bearing Roller Chain (DT)
RF 03	5,400	14,000
RF 05	12,500	33,300
RF 08 • 450	14,300	36,700
RF 10	20,500	53,300
RF 12	33,900	90,000
RF 17	44,600	116,700
RF 26	57,100	150,000
RF 36	86,600	230,000
RF 60	91,100	-
RF 90	143,800	-
RF120	201,800	-

From the comparison between allowable roller load and allowable loading mass, chain should be selected from allowable roller load as follows:
Bearing Roller Chain = RF12250F-1LA2 (DT)
RF Standard Chain = RF26250F-1LA2 (DT)
3. Motor Size

Motor kW = (TXV/54.5) x (1/η)
Bearing Roller Chain (When f = 0.03 and η = 0.85)
T = 2000 kg x g/1000 x 40 pcs x 0.03 = 23.5 kN (2400 kgf)
kW = 23.5 X 10/54.5 x 1/0.85 = 5.1 kW
RF Standard Chain (When f = 0.08 and η = 0.85)
T = 2000 kg x g/1000 x 40 pcs x 0.08 = 62.8 kN (6400 kgf)
kW = (62.8x10/54.5) x (1/0.85) = 13.6kW

10.2 Conveyor Type: Horizontal Slat Conveyor

Material conveyed: Carton Box
Mass of material conveyed: 40 kg/pc
Slat mass: 2 kg/pc Chain strand: 2 strands
Loading spacing: One carton box/m
Center distance: 30 m
Chain speed: 15 m/min
Sprocket: 12T
Chain spec.: Pitch = 100 mm, A2 attachment every link F roller
Others: No lubrication

The following are calculated or selected:
(1) Required chain quantity in links
(2) Chain size at safety factor 10
(3) Drive sprocket torque
(4) Required kW

1) Required Chain Quantity in Link (n)
n = (30000/100 x 2 + 12) x 2 = 612 x 2 = 1224 links

2) Chain Size at Safety Factor 10
From the above conditions and Table 5, tension T_1 required to convey only carton boxes is:
T_1 = 1200 x g/1000 x 0.15 = 1.77 kN
(T_1= 1200 x 0.15 = 180 kgf)
Tension T2 required to convey only slats is:
Slat Mass = 2 x 1000/100 = 20 kg/m
T_2 = 2.1 x 20 x 30 x g/1000 x 0.15 = 1.85 kN
(T_2 = 2.1 x 20 x 30 x 0.15 = 189 kgf)
$T_1 + T_2$ = 1.77 + 1.85 = 3.62 kN
($T_1 + T_2$ = 180 + 189 = 369 kgf)
Tentatively select *RF03100F-1LA2 to calculate tension T3 required to move only chain.
A.T.S = 29 kN/strand x 2 strands = 58 kN (6000 kgf)
T_3 = 2.1 x (2.4 x 2 + [0.06/(100/1000)] x 2) x 30 x g/1000 x 0.15 = 0.56 kN
(2.4 = Chain mass, 0.06 = Attachment mass, 2 = 2 strands, 100 = pitch, 1000 = To convert to mass per meter)
(T_3 = 2.1 x (2.4 x 2 + [0.06/(100/1000)] x 2) x 30 x 0.15 = 426 kgf)

Safety Factor when RF03100F 1LA2 is used is:

$T = T_1+T_2 + T_3 = 1.77 + 1.85 + 0.56 = 4.18$ kN
($T = T_1 + T_2 + T_3 = 180 +189 + 56.7 = 426$ kgf)

Sf = (29X2)/4.18 = 14 (Sf = (3000 X 2)/426 = 14)

Allowable roller load and allowable attachment load are satisfied with RF03100F 1LA2.

3) Drive Sprocket Torque: Tr

PCD = 386.4mm
Tr = 4.18 x 386.4 x 1/2 x 1/1000 = 0.8 kN _m
(Tr = 426 x 386.4 x 1/2 x 1/1000 = 82.3 kgf_m)

4) Required kW

kW = ((4.18 x 15)/54.5) x 1/0.85 = 1.35 kW
(kW = ((426 x 15)/5565) x 1/0.85 = 1.35 kW)

10.3 Conveyor Type: Continuous Vertical Bucket Elevator

Lift distance:	30 m
Chain spec.:	Pitch = 250, G4 attachment, at every 2nd link, S roller, Bucket elevator chain
Conveyor capacity:	100 ton/hour
Chain speed:	28 m/min
Sprocket:	12T
Mass of bucket:	25 kg/pc

The following are calculated or selected:
(1) Required chain quantity in links
(2) Chain size at Safety Factor 10 or over
(3) Drive sprocket torque
(4) Required kW

1) Required Chain Quantity in Links (n)

n = (30000/250 x 2+12) x 2 = 252 x 2 = 504 links

2) Chain Size

Tension T required to convey only material is:
$T_1 = 16.7 \times 100/28 \times (30+1) \times g/1000 = 18.1$ kN
($T_1 = 16.7 \times 100/28 \times (30 + 1) = 1849$ kgf)

Tension T required to convey only buckets is:
Mass of Bucket = 25 kg x 2 = 50 kg/m
$T_2 = 50 \times g/1000 \times (30 + 1) = 15.2$ kN
($T_2 = 50 \times (30 + 1) = 1550$ kgf)
$T_1 + T_2 = 18.1 + 15.2 = 33.3$ kN
($T_1 + T_2 = 1849 + 1550 = 3399$ kgf)
Tentatively select*B17250S 2LG4 (15 kg/m) to calculate tension T_3 required to move only chain.
A.T.S. = 245 x 2 = 490 kN
(25000 x 2 = 50000 kgf)
$T_3 = 15 \times 2 \times (30+1) \times g/1000 = 9.12$ kN
($T_3 = 15 \times 2 \times (30+1) = 930$ kgf)
$T = T_1 + T_2 + T_3 = 18.1 + 15.2 + 9.12 = 42.4$ kN
($T = T_1 + T_2 + T_3 = 1849 + 1550 + 930 = 4329$ kgf)
Safety Factor when B17250S 2LG4 is used is:
Sf = 490/42.4 = 11.6
(Sf = 50000/4329 = 11.6)
B17250S 2LG4 can be selected.

3) Drive Sprocket Torque: Tr

In vertical bucket elevator, mass of chain and bucket are counterbalanced. From this, tension related to torque and kW is only tension T.
PCD = 965.9mm
Tr = 18.1 x (965.9 x 1/2) x 1/1000 = 8.74 kN/m.
(Tr =1849 x (965.9 x 1/2) x 1/1000 = 893 kgf/m)

4) Required kW

kW = ((18.1 x 28)/54.5) x 1/0.85 = 10.9 kW
kW = ((1849 x 28)/5565) x 1/0.85 = 10.9 kW

Calculation of Required kW
1 kW = 1 kW•m/s (1 kW = 102 kgf•m/s)
kW = ((T x V)/60)
kW = ((T x V)/(102 x 60))

Supposed power transmission loss due to rotating friction of sprocket, engagement of chain and sprocket, etc. is about 10%.
(1/0.9 = 1.1)

η = Mechanical efficiency of drive unit
kW = ((T x V)/60) x 1.1 x 1/ η
kW =((T x V)/(102 x 60)) x 1.1 x 1/ η

11.CHAIN SIZE

Multiply tension TMAX calculated with formulas in Table 3 by Safety Factors in Table 8 for required tensile strength, and then select chain which satisfies the strength.

Chain Tension TMAX: kN (kgf)
x
1/Chain Strands
x
Chain Speed-Temperature Safety Factor (Kv)
x
Operation Time Factor (Ks)
≤
Average Tensile Strength kN (kgf)

Notes:

1) When there are any regulations, guidelines, etc. effecting chain selection, select chain based on the regulation and the Safety Factor Selection explained in this page. Then take the larger or stronger chain.

2) When a conveyor consists of multiple strands of chain, correct the number of strands in the above formula to allow for uneven load to the chain.

3) In the following applications, chain life is reduced to 1/2 - 1/10. Determine safety factor referring to point 14 on page C-191.

CONSIDERATIONS FOR SPECIAL ENVIRONMENTS
1. Short distance transportation of heavy load
2. Exposure of chain to abrasive, adhesive and corrosive material
3. High temperature environments
4. High humidity
5. No lubrication

4) Bearing Roller Chain, Plastic Sleeve chain, Bearing Bush Chain and EPC78 to be selected by allowable tension.

Table 8: Chain Speed-Temperature Safety Factor Kv conditions: Clean environment and well lubricated

Chain Series / Temperature / Chain Speed m/min	Standard Series		Reinforced Series				Stainless Steel 400 Series				Stainless Steel 300 Series			
	Under 100	100-200	Under 100	100-200	200-300	300-400	Under 100	100-200	200-300	300-400	Under 100	100-200	200-300	300-400

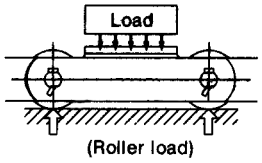
Table 9: Operation Time Factor Ks

Operation Time h/day	Ks
Less than 10 hours	1
10 to 24 hours	1.2

12. ALLOWABLE ROLLER LOAD UNDER LUBRICATED CONDITIONS

Allowable load per roller under lubricated condition in loading type conveyor is as per Table 10. Where A2 attachment is used, its allowable load should be compared to that of roller, and smaller value to be taken. Tensile strength 400N/mm^2 (41 kgf/ mm^2) is minimum requirement for guide rail. Allowable roller load should also be checked when corner rail is set up in a conveyor.



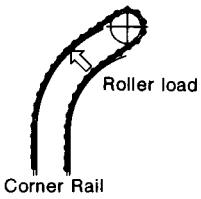


Table 10: Allowable Roller Load Under Luricated Conditions kN(kgf)/pc

Chain Size	R, F		S, M, N, Roller (Heat Treated)	Plastic Roller Series	Bearing Roller Series		Bearing Bush Series

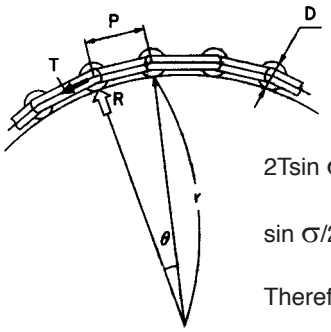
13. ALLOWABLE LOAD FOR STANDARD "A" ATTACHMENT

Allowable vertical load for A type attachment is as per Table 11. Where the load works with roller, allowable roller load should be compared to that of attachment, and smaller value to be taken. When "A" attachment receives twisting force, please Contact Tsubaki Technical Support.

Reaction Force of Rail (R)



$2T\sin\sigma/2 = R$

$\sin\sigma/2 = (P/2)/(r + D/2)$

Therefore $R = 2T \times P/(2r + D)$

Table 11: Allowable Load For "A" Attachment kN(kgf)/pc

Chain Size	Standard Series DT	Reinforced Series AT
RF03075	0.78 (80)	1.18 (120)

Note: Please multiply "A" by two for "K" attachment.

14. CONSIDERATIONS FOR SPECIAL ENVIRONMENTS

Special environments mean the following conditions:
- high temperature
- low temperature
- high humidity
- high dust
- high chemical reactions

Combinations of the above conditions often exist where chain is used. Therefore, to achieve satisfactory chain life, it is important that to select adequate material.

14.1 At Low Temperatures

When chain is used at low temperatures, the following should be considered.

1. Low temperature brittleness of material.

In general, steel materials become brittle at low temperatures depending on chemical composition, etc. RF Conveyor Chain should not be used at temperatures lower than those specified in Table 12.

Table 12: Applicable Lowest Temperature

RF Conveyor Chain	Lowest Temperature
Standard Series (DT)	-20°C
Reinforced Series (AT)	-60°C
400 Stainless Series (NT, PT)	-70°C
300 Stainless Series (ST)	-100°C

2. Freezing of chain.

Freezing between pin and bushing, inner and outer linkplates, or bushing and roller will cause an excessive load on chain and drive unit. Freezing should be avoided by generally filling gaps between parts with lubricant, which does not freeze at the temperature the chain is used in. For this purpose, silicon grease is recommended.

14.2 At High Temperatures Over 400°C

Strength of chain decreases as temperature of chain increases by being heated up by the heat of material conveyed or environment. Limits to use of each chain are determined by temperature of chain and material. For Safety Factor at temperature up to 400°C, please refer to Table 8, and for over 400°C, please consult with TSUBAKI.

Points Concerning Heated Chain

1. Friction factor gets larger than usual.
2. There is a possibility to cause heat fatigue when different materials have been welded, due to the difference of heat expansion coefficient.
3. In environments at temperatures over 400°C, heat expansion and clearance are to be considered.
4. Creep breakage.
5. High temperature brittleness.
6. Carbide precipitation brittleness.
7. Effect of fluctuating temperatures (cooling and expansion).

Points Concerning Lubricant

1. Heat resistance of silicon, graphite and molybedenum disulphide oil are superior.

14.3 Abrasiveness

Points Concerning Abrasive Conditions

1. Install chain cover to avoid exposure to abrasive material.
2. Select adequate conveyor type when exposing chain to abrasive material.
3. Slow down chain speed as much as possible.
4. Make chain size larger to reduce bearing pressure between pin and bushing.
5. Lubricate through grease fitting. (Please consult with Tsubaki Technical Support).

14.4 Corrosiveness

When chain is exposed to corrosive material:

1. Chain parts get thin. Wear is accelerated.
2. Rust affects rotation of roller and articulation of chain.
3. Special considerations to be taken for stress corrosiveness and intergranular corrosiveness when chain is used under acid or alkaline environments.

Please refer to Table 13 when selecting chain. It shows anticorrosiveness of chain material to various kinds of solvent. Chain parts made of 400 stainless steel may rust depending upon conditions.

Specifications for antistress corrosiveness are available. (Please Contact Tsubaki Technical Support.) With regard to corrosiveness, please inform Tsubaki Technical Support of materials of accessories and related equipment. For example, when chain is used in a tank, the material of the tank is important information. In this case, it may be possible to prevent electric corrosion beforehand.

Table 13: Anti-corrosiveness to Various Kinds of Solvent

When selecting chain, please check whether or not material is fully anticorrosive by referring to this table. This table shows properties of material at 20°C and is only to be taken as a guide. To determine final specifications of chain, please consider all conditions together.

O: Resistant
X: Not resistant
▲: Resistant depending upon conditions
- : Unknown

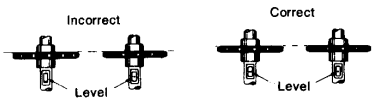
RF Metric Series Chain Selection Guide

INSTALLATION AND MAINTENANCE

1. Installation of Sprocket

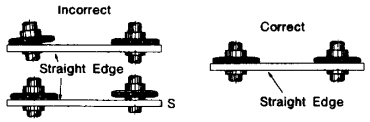
Proper alignment of sprocket and shaft is essential for smooth operation of conveyors and long lasting service of conveyor chain. To ensure correct alignment, proceed using following steps.

a. Level the shaft. Angular alignment should be adjusted within a gradient of 1/300.



b. Align the shaft for parallelism using a straight edge or a scale. Tolerance for parallel alignment of shafts should be within 1mm.

c. Align the sprockets axially on the shafts using a straight bar or a stretched wire as illustrated below.



Alignment accuracy should be as follows:

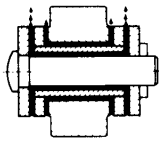
Center distance up to 1 m: ± 1 mm
1 m to 10m: Center Distance (mm)/1000
over 10m: ±10 mm

Notes:

1. It is required that at least three teeth of the sprocket are engaged with chain.
2. Installation of take-up unit is an effective way to adjust for chain elongation.
3. It is required to phase teeth of sprockets when multiple strands of chain are used in parallel.

2. Lubrication

Conveyor chain requires proper lubrication, which reduces wear on the conveyor chain and economizes the horsepower. Lubrication is generally applied once a week by pouring or brushing ISO VG100-150 (SAE30-40) oil.



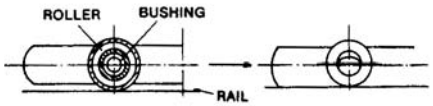
3. Life of Conveyor Chain and Sprocket

As conveyor chain runs, wear appears on each part of the chain. The life of conveyor chain is determined not only by the pitch elongation but also by the wear of each component part. It is recommended to do periodical inspection on the wearing parts as per the following examples.

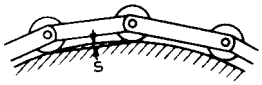
1) Roller

A) "R" roller, "F" roller

If the link plates start to contact with the track or rail due to wear of the rollers, replacement of chain is required. When there is a corner rail, allowable wear amount is decreased by a dimension equivalent to "S".

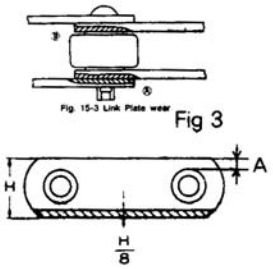


B) "S" roller Chain life comes to an end when holes or crevices appear on some rollers due to wear.



2) Bushing Chain can last until holes appear on bushings.

3) Link plate Reciprocal friction between inner and outer link plates and contact between side surface of roller and inside surface of link plate develop such wear as (A) and (B) in Fig. 3. If the amount of wear exceeds 1/3 of original plate thickness, tensile strength of chain is decreased critically. When such wear appears prior to that of other component parts, misalignment is the probable cause in most cases. Careful and periodical inspection is required to keep correct alignment of sprockets and shafts, refer to the first paragraph of INSTALLATION OF SPROCKET. For Flow Conveyor Chain, link plates slide directly on the material conveyed or on casing steel plate, the chain life ends when the wear amount reaches approx. 1/3 of "H".



The following should be avoided as it may deform link plate hole or break chain:

1. To apply overload
2. To grind down outer diameter of pin, outer diameter of bushing and link plate hole or to heat up link plate at disassembly or assembly of chain.

4) Elongation of chain pitch

When chain engages with sprocket or runs on the bent section of the track rail, flexion of the chain arises, thereby causing the chain to stretch due to the wear of such bearing parts as pins and bushings. When the chain pitch becomes larger, the chain tends to climb the sprocket tooth. The limit of pitch elongation is generally 2% of the chain pitch.

To check elongation of chain pitch, measure as many number of pitches as possible (at least 4 pitches required). Measuring points are:

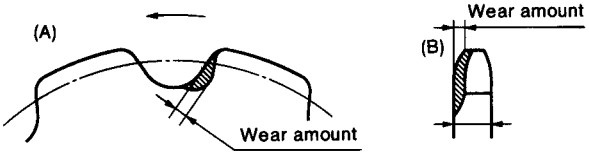
A=Pin center to pin center
B = Pin edge to pin edge

The elongation of chain is calculated by comparing the actually measured pitch with the original chain pitch.

5) Wear of sprocket

When a sprocket is worn out, chain tends to cling to the sprocket and to vibrate. In this case, build up welding is required for repair. Although allowable wear amount slightly varies with conveyor type and chain size, it is recommended to repair or replace sprocket with wear amount 3-6 mm to prevent chain from being damaged.

(A) Misalignment causes wear on side of sprocket teeth. Correction of the alignment is required. (B)



INSTALLATION AND MAINTENANCE FOR CONVEYOR CHAINS

Checkpoint

When handling and dismantling Conveyor chains:

- Always wear the proper protective clothing (safety glasses, gloves, safety shoes, etc.) suitable for the operations involved.
- When supporting Conveyor chains, make sure that the Conveyor chain and it's parts do not move freely.
- The use of pressing equipment is recommended. Jigs should be properly used.
- Pins should be inserted and removed in the correct direction.

Make sure to install safety devices (safety covers, etc.) on the equipment of all Conveyor chains and sprockets.

Make sure that power is OFF before installation, dismantling, lubrication and maintenance inspection of Conveyor chains and take precautions to ensure that the power will remain off throughout.

Perform operations in a safe manner by arranging the surroundings so that no secondary accidents may occur.

When replacing Conveyor chains, note the following:

- The strengths of Conveyor chains differ depending on the maker. When a selection has been made at the time of purchasing or replacing based on this catalog, make sure to use our company's products.
- Avoid replacing only areas that are partially worn or damaged. In such cases replace all with new parts.

Universal Product Cross-Reference

This chart is a quick, easy way to replace your current chains and sprockets with high-quality, reliable products from Tsubaki The list is sorted by chain number, and you'll find the corresponding Tsubaki number listed for each.

The chart was compiled with great care and with the latest information available at the time of printing. Because of the possibility of errors in competitors' publications or changes in product specifications, Tsubaki does not assume responsibility for the accuracy of competitors' information. Please check the chain or sprocket specifications on the corresponding page numbers carefully before ordering.

Chain Interchangeability Guidelines

There are several degrees of interchangeability for chain replacement between manufacturers' chains.

1. **Intercoupling of Chains**
   The pin of one chain can be put through the bushing of another. However, the pin and outside sidebars must be produced by the same manufacturer. When connected, the two chains form one strand.

2. **Interchanging of Parts**
   Because each manufacturer has different part designs and tolerances, interchanging parts is not suggested. Due to the differences in tolerances, we suggest you use Tsubaki replacement parts for Tsubaki chains.

3. **Running on the Same Sprocket**
   Many replacement chains will run on the same sprockets even though they are not the same chains. The following dimensions must be equivalent in the original and replacement chains to run on the same sprocket.
   - Pitch
   - Roller, barrel, or bushing diameter (depending on chain type)
   - Inside width

If you have any questions about using the Universal Product Cross-Reference or interchangeability in general, contact Tsubaki Technical Support. We can help you select the right replacement chain or sprocket for your application.
